JTEKT

**BALL & ROLLER
BEARINGS**

A New Legacy Begins April 2022

Starting in April 2022, JTEKT Corporation began unifying its Koyo and Toyoda global brands to the JTEKT brand. For bearings this means the **Koyo** brand name and logo will transition to **JTEKT**.

This step is intended to guarantee a unified market presence of our globally operating company. Please be informed that this is only a change of brand name and logo. The company, the people, the products, the services and the corporate structure will remain the same. You can rely on the continued outstanding service and product quality in the future under the JTEKT brand name that you've become accustomed to in the past with Koyo.

We sincerely appreciate your support of Koyo bearings and look forward to your support of JTEKT bearings moving forward.

	up to now	NEW from April 2022
Brand name for Automotive Components and Steering Systems	JTEKT	JTEKT
Brand name for Bearings	Koyo	
Brand name for Machine Tools	TOYODA	

JTEKT

Publication of Rolling Bearing Catalog

Today's technology-based society, in order to utilize the earth's limited resources effectively and protect the environment, must strive to develop new technologies and alternate energy sources, and in that connection it continues to pursue new targets in various fields. To achieve such targets, technically advanced and highly functional rolling bearings with significantly greater compactness, lighter weight, longer life and lower friction as well as higher reliability during use in special environments are sought.

This new-edition catalog is based on the results of wide-ranging technical studies and extensive R&D efforts and will enable the reader to select the optimal bearing for each application.

JTEKT is confident that you will find this new catalog useful in the selection and use of rolling bearings. JTEKT is grateful for your patronage and look forward to continuing to serve you in the future.

★The contents of this catalog are subject to change without prior notice. Every possible effort has been made to ensure that the data herein is correct; however, JTEKT cannot assume responsibility for any errors or omissions.

Reproduction of this catalog without written consent is strictly prohibited

1. Rolling bearing structures and types

1-1 Structure

Rolling bearings (bearings hereinafter) normally comprise bearing rings, rolling elements and a cage. (see Fig. 1-1)

Rolling elements are arranged between inner and outer rings with a cage, which retains the rolling elements in correct relative position, so they do not touch one another. With this structure, a smooth rolling motion is realized during operation.

Bearings are classified as follows, by the number of rows of rolling elements : single-row, double-row, or multi-row (triple- or four-row) bearings.

Note) In thrust bearings inner and outer rings are also called "shaft race" and "housing race" respectively. The race indicates the washer specified in JIS.

Fig. 1-1 Bearing structure

1) Bearing rings

The path of the rolling elements is called the raceway; and, the section of the bearing rings where the elements roll is called the raceway surface. In the case of ball bearings, since grooves are provided for the balls, they are also referred to as raceway grooves.

The inner ring is normally engaged with a shaft; and, the outer ring with a housing.

2) Rolling element

Rolling elements may be either balls or rollers. Many types of bearings with various shapes of rollers are available.

- Ball
- Cylindrical roller ($L_W \leq 3 D_W$)*
- ▬ Long cylindrical roller ($3D_W \leq L_W \leq 10D_W$, $D_W > 6 \text{ mm}$)*
- ▬ Needle roller ($3D_W \leq L_W \leq 10D_W$, $D_W \leq 6 \text{ mm}$)*
- ▭ Tapered roller (tapered trapezoid)
- ▭ Convex roller (barrel shape)

* $\left(\begin{array}{l} L_W : \text{roller length (mm)} \\ D_W : \text{roller diameter (mm)} \end{array} \right)$

3) Cage

The cage guides the rolling elements along the bearing rings, retaining the rolling elements in correct relative position. There are various types of cages including pressed, machined, molded, and pin type cages.

Due to lower friction resistance than that found in full complement roller and ball bearings, bearings with a cage are more suitable for use under high speed rotation.

1-2 Type

The contact angle (α) is the angle formed by the direction of the load applied to the bearing rings and rolling elements, and a plan perpendicular to the shaft center, when the bearing is loaded.

Bearings are classified into two types in accordance with the contact angle (α).

- Radial bearings ($0^\circ \leq \alpha \leq 45^\circ$)
... designed to accommodate mainly radial load.
- Thrust bearings ($45^\circ < \alpha \leq 90^\circ$)
... designed to accommodate mainly axial load.

Rolling bearings are classified in Fig. 1-2, and characteristics of each bearing type are described in Tables 1-1 to 1-13.

Fig. 1-2(1) Rolling bearings

Bearings classified by use

Fig. 1-2(2) Rolling bearings

1. Rolling bearing structures and types

Table 1-1 Deep groove ball bearings

Single-row							Double-row
Open type	Shielded type	Non-contact sealed type	Contact sealed type		Extremely light contact sealed type	With locating snap ring	Flanged type
	ZZ	2RU	2RS	2RK	2RD	NR	(Suitable for extra-small or miniature bearing)
680, 690, 6700, 6800, 6900, 16000, 6000, 6200, 6300, 6400		600, 620, 630, (ML)	...Extra-small, miniature bearing				4200, 4300

- The most popular types among rolling bearings, widely used in a variety of industries.
- Radial load and axial load in both directions can be accommodated.
- Suitable for operation at high speed, with low noise and low vibration.
- Sealed bearings employing steel shields or rubber seals are filled with the appropriate volume of grease when manufactured.
- Bearings with a flange or locating snap ring attached on the outer ring are easily mounted in housings for simple positioning of housing location.

[Recommended cages] Pressed cage (ribbon type, snap type ... single-row, S type ... double-row), copper alloy or phenolic resin machined cage, synthetic resin molded cage

[Main applications] Automobile : front and rear wheels, transmissions, electric devices
Electric equipment : standard motors, electric appliances for domestic use
Others : measuring instruments, internal combustion engines, construction equipment, railway rolling stock, cargo transport equipment, agricultural equipment, equipment for other industrial uses

Bearing size (Reference) Unit : mm

Connotation	Bore diameter	Outside diameter
Miniature	–	Under 9
Extra-small	Under 10	9 or more
Small size	10 or more	80 or less
Medium size	–	80 – 180
Large size	–	180 – 800
Extra-large size	–	Over 800

Table 1-2 Angular contact ball bearings

Single-row	Matched pair	Double-row
For high-speed use	Back-to-back arrangement	Face-to-face arrangement
(With pressed cage)	DB	DF
(With machined cage)	DT	
HAR		
7000, 7200, 7300, 7400	Contact angle 30°	3200
7000B, 7200B, 7300B, 7400B	40°	3300
7900C, 7000C, 7200C, 7300C	15°	Contact angle 32°
HAR900C, HAR000C		Contact angle 24°

- Bearing rings and balls possess their own contact angle which is normally 15°, 30° or 40°.
 - ┌ Larger contact angle ... higher resistance against axial load
 - └ Smaller contact angle ... more advantageous for high-speed rotation
- Single-row bearings can accommodate radial load and axial load in one direction.
- DB and DF matched pair bearings and double-row bearings can accommodate radial load and axial load in both directions. DT matched pair bearings are used for applications where axial load in one direction is too large for one bearing to accept.
- HAR type high speed bearings were designed to contain more balls than standard bearings by minimizing the ball diameter, to offer improved performance in machine tools.
- Angular contact ball bearings are used for high accuracy and high-speed operation.

- Axial load in both directions and radial load can be accommodated by adapting a structure pairing two single-row angular contact ball bearings back to back.
- For bearings with no filling slot, the sealed type is available.

[Recommended cages] Pressed cage (conical type ... single-row : S type, snap type ... double-row), copper alloy or phenolic resin machined cage, synthetic resin molded cage

[Main applications] Single-row : machine tool spindles, high frequency motors, gas turbines, centrifugal separators, front wheels of small size automobiles, differential pinion shafts
Double-row : hydraulic pumps, roots blowers, air-compressors, transmissions, fuel injection pumps, printing equipment

Contact angles (Reference)

Contact angle	Supplementary code
15°	C
20°	CA
25°	AC
30°	A (Omitted)
35°	E
40°	B

"G type" bearings are processed (with flush ground) such that the stand-out turns out to be $\delta_1 = \delta_2$. The matched pair DB, DF, and DT, or stack are available.

Table 1-3 Four-point contact ball bearings

One-piece type	Two-piece inner ring	Two-piece outer ring
		
—	6200BI 6300BI	(6200BO) (6300BO)

- Radial load and axial load in both directions can be accommodated.
- A four-point contact ball bearing can substitute for a face-to-face or back-to-back arrangement of angular contact ball bearings.
- Suitable for use under pure axial load or combined radial and axial load with heavy axial load.
- This type of bearing possesses a contact angle (α) determined in accordance with the axial load direction. This means that the bearing ring and balls contact each other at two points on the lines forming the contact angle.

[Recommended cage] Copper alloy machined cage

[Main applications]

Motorcycle : Transmission, driveshaft pinion-side
Automobile : Steering, transmission

Table 1-4 Self-aligning ball bearings

Cylindrical bore	Tapered bore	Sealed
	 K (Taper 1 : 12)	 2RS
120, 130 1200, 1300 2200, 2300	(11200, 11300... extended inner ring type)	2200 2RS 2300 2RS

- Spherical outer ring raceway allows self-alignment, accommodating shaft or housing deflection and misaligned mounting conditions.
- Tapered bore design can be mounted readily using an adapter.

Pressed cage { staggered type...12, 13,
22...2RS, 23...2RS
snap type 22, 23

Power transmission shaft of wood working and spinning machines, plunger blocks

Table 1-5 Cylindrical roller bearings

Single-row						Double-row		Four-row
								
NU	NJ	NUP	N	NF	NH	NN	NNU	(Mainly use on rolling mill roll neck)
NU1000, NU200 (R), NU300 (R), NU400 NU2200 (R), NU2300 (R) NU3200, NU3300						Cylindrical bore NNU4900 NN3000	Tapered bore NNU4900K NN3000K	(FC) , (4CR)

- Since the design allowing linear contact of cylindrical rollers with the raceway provides strong resistance to radial load, this type is suitable for use under heavy radial load and impact load, as well as at high speed.
- N and NU types are ideal for use on the free side: they are movable in the shaft direction in response to changes in bearing position relative to the shaft or housing, which are caused by heat expansion of the shaft or improper mounting.

[Recommended cages] Pressed cage (Z type), copper alloy machined cage, pin type cage, synthetic resin molded cage

[Main applications] Large and medium size motors, traction motors, generators, internal combustion engines, gas turbines, machine tool spindles, speed reducers, cargo transport equipment, and other industrial equipment

Table 1-6 Machined ring needle roller bearings

Single-row			Double-row	
With inner ring	Without inner ring	Sealed	With inner ring	Without inner ring
NA4800 NA4900 NA6900 (NKJ, NKJS)	RNA4800 RNA4900 RNA6900 (NK, NKS, HJ)	NA49002RS — (HJ.2RS)	NA6900 (d ≥ 32)	RNA6900 (Fw ≥ 40)

- In spite of their basic structure, which is the same as that of NU type cylindrical roller bearings, bearings with minimum ring sections offer space savings and greater resistance to radial load, by using needle rollers.
- Bearings with no inner rings function using heat treated and ground shafts as their raceway surface.

[Recommended cage] Pressed cage

[Main applications] Automobile engines, transmissions, pumps, power shovel wheel drums, hoists, overhead traveling cranes, compressors

(Reference) Many needle roller bearings other than those with machined ring are available. For details, refer to the pages for the needle roller bearing specification tables and the dedicated "Needle Roller Bearings" catalog (CAT No. B2020E), published separately.

Table 1-7 Tapered roller bearings

Single-row		Double-row		Four-row
Flanged type		TDO type	TDI type	(Mainly used on rolling mill roll necks)

33100JR	30300JR	32300CR		(47T)
	32300JR			(4TR)
		46200	45200	
		46200A	45300	
		46300	(45T)	
		46300A		
		(46T)		

- Tapered rollers assembled in the bearings are guided by the inner ring back face rib.
- The raceway surfaces of inner ring and outer ring and the rolling contact surface of rollers are designed so that the respective apexes converge at a point on the bearing center line.
- Single-row bearings can accommodate radial load and axial load in one direction, and double-row bearings can accommodate radial load and axial load in both directions.
- This type of bearing is suitable for use under heavy load or impact load.
- Bearings are classified into standard, intermediate and steep types, in accordance with their contact angle (α). The larger the contact angle is, the greater the bearing resistance to axial load.
- Since outer ring and inner ring assembly can be separated from each other, mounting is easy.
- Bearings designated by the suffix "J" and "JR" are interchangeable internationally.
- Items sized in inches are still widely used.

[Recommended cages] Pressed cage, synthetic resin molded cage, pin type cage

[Main applications] Automobile : front and rear wheels, transmissions, differential pinion
Others : machine tool spindles, construction equipment, large size agricultural equipment, railway rolling stock speed reduction gears, rolling mill roll necks and speed reducers, etc

Table 1-8 Spherical roller bearings

Cylindrical bore			Tapered bore
Convex asymmetrical roller type	Convex symmetrical roller type		
			
R, RR	RZ	RHA	K or K30
23900R, 23000R (RZ, RHA), 23100R (RZ, RHA), 22200R (RZ, RHA), 21300R (RZ) 24000R (RZ, RHA), 24100R (RZ, RHA), 23200R (RZ, RHA), 22300R (RZ, RHA)			

■ Spherical roller bearings comprising barrel-shaped convex rollers, double-row inner ring and outer ring are classified into three types : R(RR), RZ and RHA, according to their internal structure.

■ With the bearing designed such that the circular arc center of the outer ring raceway matches with the bearing center, the bearing is self-aligning, insensitive to errors of alignment of the shaft relative to the housing, and to shaft deflection.

■ This type can accommodate radial load and axial load in both directions, which makes it especially suitable for applications in which heavy load or impact load is applied.

■ The tapered bore type can be easily mounted/dismounted by using an adapter or withdrawal sleeve.

There are two types of tapered bores (tapered ratio) :

- 1 : 30 (supplementary) ... Suitable for series 240 and 241. (code K30)
- 1 : 12 (supplementary) ... Suitable for series other than 240 and 241. (code K)

■ Lubrication holes, a lubrication groove and anti-rotation pin hole can be provided on the outer ring. Lubrication holes and a lubrication groove can be provided on the inner ring, too.

[Recommended cages] Copper alloy machined cage, pressed cage

[Main applications] Paper manufacturing equipment, speed reducers, railway rolling stock axle journals, rolling mill pinion stands, table rollers, crushers, shaker screens, printing equipment, wood working equipment, speed reducers for various industrial uses, plummer blocks

Table 1-9 Thrust ball bearings

Single direction			Double direction		
With flat back faces	With spherical back face	With aligning seat race	With flat back faces	With spherical back faces	With aligning seat races
					
51100 51200 51300 51400	— 53200 53300 53400	— 53200U 53300U 53400U	— 52200 52300 52400	— 54200 54300 54400	— 54200U 54300U 54400U

■ This type of bearing comprises washer-shaped rings with raceway groove and ball and cage assembly.

■ Races to be mounted on shafts are called shaft races (or inner rings); and, races to be mounted into housings are housing races (or outer rings). Central races of double direction bearings are mounted on the shafts.

■ Single direction bearings accommodate axial load in one direction, and double direction bearings accommodate axial load in both directions. (Both of these bearings cannot accommodate radial loads.)

■ Since bearings with a spherical back face are self-aligning, it helps to compensate for mounting errors.

[Recommended cages] Pressed cage, copper alloy or phenolic resin machined cage, synthetic resin molded cage

[Main applications] Automobile king pins, machine tool spindles

[Remark] The race indicates the washer specified in JIS.

Table 1-10 Cylindrical roller thrust bearings

Single direction

(811, 812, NTHA)

- This type of bearing comprises washer-shaped rings (shaft and housing race) and cylindrical roller and cage assembly.
- Crowned cylindrical rollers produce uniform pressure distribution on roller/raceway contact surface.
- Axial load can be accommodated in one direction.
- Great axial load resistance and high axial rigidity are provided.

[Recommended cages] Copper alloy machined cage

[Main applications] Oil excavators, iron and steel equipment

Table 1-11 Needle roller thrust bearings

Separable	Non-separable
	
(AXK, FNT, NTA)	(FNTKF)

- The separable type, comprising needle roller and cage thrust assembly and a race, can be matched with a pressed thin race (AS) or machined thick race (LS, WS.811, GS.811).
- The non-separable type comprises needle roller and cage thrust assembly and a precision pressed race.
- Axial load can be accommodated in one direction.
- Due to the very small installation space required, this type contributes greatly to size reduction of application equipment.
- In many cases, needle roller and cage thrust assembly function by using the mounting surface of the application equipment, including shafts and housings, as its raceway surface.

Pressed cage, synthetic resin molded cage

Transmissions for automobiles, cultivators and machine tools

[Remark] The race indicates the thrust washer or washer specified in JIS.

Table 1-12 Tapered roller thrust bearings

Single direction	Double direction
	
(T) (THR)	(2THR)

- This type of bearing comprises tapered rollers (with spherical large end), which are uniformly guided by ribs of the shaft and housing races.
- Both shaft and housing races and rollers have tapered surfaces whose apexes converge at a point on the bearing axis.
- Single direction bearings can accommodate axial load in one direction; and, double direction bearings can accommodate axial load in both directions.
- Double direction bearings are to be mounted such that their central race is placed on the shaft shoulder. Since this type is treated with a clearance fit, the central race must be fixed with a sleeve, etc.

[Recommended cages] Copper alloy machined cage

[Main applications]
Single direction : crane hooks, oil excavator swivels
Double direction : rolling mill roll necks

Table 1-13 Spherical thrust roller bearings

29200 29300 29400

- This type of bearing, comprising barrel-shaped convex rollers arranged at an angle with the axis, is self-aligning due to spherical housing race raceway; therefore, shaft inclination can be compensated for to a certain degree.
- Great axial load resistance is provided. This type can accommodate a small amount of radial load as well as heavy axial load.
- Normally, oil lubrication is employed.

Copper alloy machined cage

Hydroelectric generators, vertical motors, propeller shafts for ships, screw down speed reducers, jib cranes, coal mills, pushing machines, molding machines

2. Outline of bearing selection

Currently, as bearing design has become diversified, their application range is being increasingly extended. In order to select the most suitable bearings for an application, it is necessary to conduct a comprehensive study on both bearings and the equipment in which the bearings will be installed, including operating conditions, the performance required of the

bearings, specifications of the other components to be installed along with the bearings, marketability, and cost performance, etc.

In selecting bearings, since the shaft diameter is usually determined beforehand, the prospective bearing type is chosen based upon installation space, intended arrangement, and according to the bore diameter required.

Next, from the bearing specifications are determined the service life required when compared to that of the equipment in which it is used, along with a calculation of the actual service life from operational loads.

Internal specifications including bearing accuracy, internal clearance, cage, and lubricant are also selected, depending on the application.

For reference, general selection procedure and operating conditions are described in Fig. 2-1. There is no need to follow a specific order, since the goal is to select the right bearing to achieve optimum performance.

Fig. 2-1(1) Bearing selection procedure

Fig. 2-1(2) Bearing selection procedure

3. Selection of bearing type

In selecting bearings, the most important thing is to fully understand the operating conditions of the bearings.

The main factors to be considered are listed in Table 3-1, while bearing types are listed in Table 3-2.

Table 3-1 (1) Selection of bearing type

Items to be considered	Selection method	Reference page No.
1) Installation space Bearing can be installed in target equipment	- When a shaft is designed, its rigidity and strength are considered essential; therefore, the shaft diameter, i.e., bore diameter, is determined at start. - For rolling bearings, since wide variety with different dimensions are available, the most suitable bearing type should be selected. (Fig. 3-1)	A 52
2) Load Load magnitude, type and direction which applied (Load resistance of bearing is specified in terms of the basic load rating, and its value is specified in the bearing specification table.)	- Since various types of load are applied to bearings, load magnitude, types (radial or axial) and direction of application (both directions or single direction in the case of axial load), as well as vibration and impact must be considered in order to select the proper bearing. - The following is the general order for radial resistance : (deep groove ball bearings < angular contact ball bearings < cylindrical roller bearings < tapered roller bearings < spherical roller bearings)	A 18 (Table 3-2) A 87
3) Rotational speed Response to rotational speed of equipment in which bearings will be installed (The limiting speed for bearing is expressed as allowable speed, and this value is specified in the bearing specification table.)	- Since the allowable speed differs greatly depending not only upon bearing type but on bearing size, cage, accuracy, load and lubrication, all factors must be considered in selecting bearings. - In general, the following bearings are the most widely used for high speed operation. (deep groove ball bearings, angular contact ball bearings, cylindrical roller bearings)	A 18 (Table 3-2) A 84
4) Running accuracy Accurate rotation delivering required performance (Dimension accuracy and running accuracy of bearings are provided by JIS, etc.)	- Performance required differs depending on equipment in which bearings are installed : for instance, machine tool spindles require high running accuracy, gas turbines require high speed rotation, and control equipment requires low friction. In such cases, bearings of tolerance class 5 or higher are required. - The following are the most widely used bearings. (deep groove ball bearings, angular contact ball bearings, cylindrical roller bearings)	A 18 (Table 3-2) A 58
5) Rigidity Rigidity that delivers the bearing performance required (When load is applied to a bearing, elastic deformation occurs at the point where its rolling elements contact the raceway surface. The higher the rigidity that bearings possess, the better they control elastic deformation.)	- In machine tool spindles and automobile final drives, bearing rigidity as well as rigidity of equipment itself must be enhanced. - Elastic deformation occurs less in roller bearings than in ball bearings. - Rigidity can be enhanced by providing preload. This method is suitable for use with angular contact ball bearings and tapered roller bearings.	A 18 (Table 3-2) A 112

Table 3-1 (2) Selection of bearing type

Items to be considered	Selection method	Reference page No.
6) Misalignment (aligning capability) Operating conditions which cause misalignment (shaft deflection caused by load, inaccuracy of shaft and housing, mounting errors) can affect bearing performance (Allowable misalignment (in angle) for each bearing type is described in the section before the bearing specification table, to facilitate determination of the self-aligning capability of bearings.)	- Internal load caused by excessive misalignment damages bearings. Bearings designed to absorb such misalignment should be selected. - The higher the self-aligning capability that bearings possess, the larger the angular misalignment that can be absorbed. The following is the general order of bearings when comparing allowable angular misalignment : (cylindrical roller bearings < tapered roller bearings < deep groove ball bearings, angular contact ball bearings < spherical roller bearings, self-aligning ball bearings)	A 18 (Table 3-2)
7) Mounting and dismounting Methods and frequency of mounting and dismounting required for periodic inspection	- Cylindrical roller bearings, needle roller bearings and tapered roller bearings, with separable inner and outer rings, are recommended for applications in which mounting and dismounting is conducted frequently. - Use of sleeve eases the mounting of self-aligning ball bearings and spherical roller bearings with tapered bore.	A 18 (Table 3-2)

4. Selection of bearing arrangement

As bearing operational conditions vary depending on devices in which bearings are mounted, different performances are demanded of bearings. Normally, two or more bearings are used on one shaft.

In many cases, in order to locate shaft positions in the axial direction, one bearing is mounted on the fixed side first, then the other bearing is mounted on the free side.

Table 4-1 Bearings on fixed and free sides

	Features	Recommended bearing type	Example No.
Fixed side bearing	- This bearing determines shaft axial position. - This bearing can accommodate both radial and axial loads. - Since axial load in both directions is imposed on this bearing, strength must be considered in selecting the bearing for this side.	Deep groove ball bearing Matched pair or stack angular contact ball bearing Double-row angular contact ball bearing Self-aligning ball bearing Cylindrical roller bearing with rib (NUP and NH types) Double-row tapered roller bearing Spherical roller bearing	Examples 1-11
Free side bearing	- This bearing is employed to compensate for expansion or shrinkage caused by operating temperature change and to allow adjustment of bearing position. - Bearings which accommodate radial load only and whose inner and outer rings are separable are recommended as free side bearings. - In general, if non-separable bearings are used on free side, clearance fit is provided between outer ring and housing to compensate for shaft movement through bearings. In some cases, clearance fit between shaft and inner ring is utilized.	- Separable types Cylindrical roller bearing (NU and N types) Needle roller bearing (NA type, etc.) - Non-separable types Deep groove ball bearing Matched pair angular contact ball bearing (Back-to-back arrangement) Double-row angular contact ball bearing Self-aligning ball bearing Double-row tapered roller bearing (TDO type) Spherical roller bearing	
When fixed and free sides are not distinguished	- When bearing intervals are short and shaft shrinkage does not greatly affect bearing operation, a pair of angular contact ball bearings or tapered roller bearings is used in paired mounting to accommodate axial load. - After mounting, the axial clearance is adjusted using nuts or shims.	Deep groove ball bearing Angular contact ball bearing Self-aligning ball bearing Cylindrical roller bearing (NJ and NF types) Tapered roller bearing Spherical roller bearing	Examples 12-16
Bearings for vertical shafts	- Bearings which can accommodate both radial and axial loads should be used on fixed side. Heavy axial load can be accommodated using thrust bearings together with radial bearings. - Bearings which can accommodate radial load only are used on free side, compensating for shaft movement.	Fixed side Matched pair angular contact ball bearing (Back-to-back arrangement) Double-row tapered roller bearing (TDO type) Thrust bearing + radial bearing	Examples 17 and 18

Table 4-2 (1) Example bearing arrangements

Example	Bearing arrangement		Recommended application	Application example
	Fixed side	Free side		
Ex. 1			- Suitable for high-speed operation; used for various types of applications. - Not recommended for applications that have center displacement between bearings or shaft deflection.	Medium size motors, air blowers
Ex. 2			- More suitable than Ex. 1 for operation under heavy load or impact load. Suitable also for high-speed operation. - Due to separability, suitable for applications requiring interference of both inner and outer rings. - Not recommended for applications that have center displacement between bearings or shaft deflection.	Traction motors for railway rolling stock
Ex. 3			- Recommended for applications under heavier or greater impact load than those in Ex. 2. - This arrangement requires high rigidity from fixed side bearings mounted back to back, with preload provided. - Shaft and housing of accurate dimensions should be selected and mounted properly.	Steel manufacturing table rollers, lathe spindles
Ex. 4			- This is recommended for operation at high speed or axial load lighter than in Ex. 3. - This is recommended for applications requiring interference of both inner and outer rings. - Some applications use double-row angular contact ball bearings on fixed side instead of matched pair angular contact ball bearings.	Motors
Ex. 5			- This is recommended for operations under relatively small axial load. - This is recommended for applications requiring interference of both inner and outer rings.	Paper manufacturing calender rollers, diesel locomotive axle journals
Ex. 6			- This is recommended for operations at high speed and heavy radial load, as well as normal axial load. - When deep groove ball bearings are used, clearance must be provided between outside diameter and housing, to prevent application of radial load.	Diesel locomotive transmissions
Ex. 7			- This arrangement is most widely employed. - This arrangement can accommodate partial axial load as well as radial load.	Pumps, automobile transmissions

Table 4-2 (2) Example bearing arrangements

Example	Bearing arrangement		Recommended application	Application example
	Fixed side	Free side		
Ex. 8			- This is recommended for operations with relatively heavy axial load in both directions. - Some applications use matched pair angular contact ball bearings on fixed side instead of double-row angular contact ball bearings.	Worm gear speed reducers
Ex. 9			- This is the optimum arrangement for applications with possible mounting errors or shaft deflection. - Bearings in this arrangement can accommodate partial axial load, as well as heavy radial load.	Steel manufacturing table roller speed reducers, overhead crane wheels
Ex. 10			- This is optimum arrangement for applications with possible mounting errors or shaft deflection. - Ease of mounting and dismounting, ensured by use of adaptor, makes this arrangement suitable for long shafts which are neither stepped nor threaded. - This arrangement is not recommended for applications requiring axial load capability.	General industrial equipment counter shafts
Ex. 11			- This is the optimum arrangement for applications with possible mounting errors or shaft deflection. - This is recommended for operations under impact load or radial load heavier than that in Ex. 10. - This arrangement can accommodate partial axial load as well as radial load.	Steel manufacturing table rollers
Arrangement in which fixed and free sides are not distinguished			Recommended application	Application example
Ex. 12			- This arrangement is most popular when applied to small equipment operating under light load. - When used with light preloading, thickness-adjusted shim or spring is mounted on one side of outer ring.	Small motors, small speed reducers, small pumps
Ex. 13	 Back-to-back Face-to-face		- This is suitable for applications in which rigidity is enhanced by preloading. This is frequently employed in applications requiring high speed operation under relatively large axial load. - Back-to-back arrangement is suitable for applications in which moment load affects operation. - When preloading is required, care should be taken in preload adjustment.	Machine tool spindles

Table 4-2 (3) Example bearing arrangements

Example	Arrangement in which fixed and free sides are not distinguished	Recommended application	Application example
Ex. 14	 Back-to-back Face-to-face	- This is recommended for operation under impact load or axial load heavier than in Ex. 13. - This is suitable for applications in which rigidity is enhanced by preloading. - Back-to-back arrangement is suitable for applications in which moment load affects operation. - When interference is required between inner ring and shaft, face-to-face arrangement simplifies mounting. This arrangement is effective for applications in which mounting error is possible. - When preloading is required, care should be taken in preload adjustment.	Speed reducers, automobile wheels
Ex. 15		- This is recommended for applications requiring high speed and high accuracy of rotation under light load. - This is suitable for applications in which rigidity is enhanced by preloading. - Tandem arrangement and face-to-face arrangement are possible, as is back-to-back arrangement.	Machine tool spindles
Ex. 16		- This arrangement provides resistance against heavy radial and impact loads. - This is applicable when both inner and outer rings require interference. - Care should be taken not to reduce axial internal clearance a critical amount during operation.	Construction equipment final drive
Application to vertical shafts		Recommended application	Application example
Ex. 17	 Fixed side Free side	This arrangement, using matched pair angular contact ball bearings on the fixed side and cylindrical roller bearings on the free side, is suitable for high speed operation.	Vertical motors, vertical pumps
Ex. 18	 Free side Fixed side	- This is recommended for operation at low speed and heavy load, in which axial load is heavier than radial load. - Due to self-aligning capability, this is suitable for applications in which shaft runout or deflection occurs.	Crane center shafts, vertical pumps

5. Selection of bearing dimensions

5-1 Bearing service life

When bearings rotate under load, material flakes from the surfaces of inner and outer rings or rolling elements by fatigue arising from repeated contact stress (ref. A 152).

This phenomenon is called flaking.

The total number of bearing rotations until flaking occurs is regarded as the bearing "(fatigue) service life".

"(Fatigue) service life" differs greatly depending upon bearing structures, dimensions, materials, and processing methods. Since this phenomenon results from fatigue distribution in bearing materials themselves, differences in bearing service life should be statistically considered.

When a group of identical bearings are rotated under the same conditions, the total number of revolutions until 90 % of the bearings are left without flaking (i.e. a service life of 90 % reliability) is defined as the basic rating life. In operation at a constant speed, the basic rating life can be expressed in terms of time.

In actual operation, a bearing fails not only because of fatigue, but other factors as well, such as wear, seizure, creep, fretting, brinelling, cracking etc (ref. A 152, 16. Examples of bearing failures).

These bearing failures can be minimized by selecting the proper mounting method and lubricant, as well as the bearing most suitable for the application.

5-2 Calculation of service life

5-2-1 Basic dynamic load rating C

The basic dynamic load rating is either pure radial (for radial bearings) or central axial load (for thrust bearings) of constant magnitude in a constant direction, under which the basic rating life of 1 million revolutions can be obtained, when the inner ring rotates while the outer ring is stationary, or vice versa. The basic dynamic load rating, which represents the capacity of a bearing under rolling fatigue, is specified as the basic dynamic radial load rating (C_r) for radial bearings, and basic dynamic axial load rating (C_a) for thrust bearings. These load ratings are listed in the specification table.

These values are prescribed by ISO 281/1990, and are subject to change by conformance to the latest ISO standards.

5-2-2 Basic rating life L_{10}

The basic rating life L_{10} is a service life of 90 % reliability when used under normal usage conditions for bearings of high manufacturing quality where the inside of the bearing is of a standard design made from bearing steel materials specified in JIS or equivalent materials.

The relationship between the basic dynamic load rating, dynamic equivalent load, and basic rating life of a bearing can be expressed using equation (5-1). This life calculation equation does not apply to bearings that are affected by factors such as plastic deformation of the contact surfaces of raceways and rolling elements due to extremely heavy load conditions (when P exceeds either the basic static load rating C_0 (refer to p. A 42) or $0.5C$) or, conversely, to bearings that are affected by factors such as the contact surfaces of raceways and rolling elements slipping due to extremely light load conditions.

If conditions like these may be encountered, consult with JTEKT.

It is convenient to express the basic rating life in terms of time, using equation (5-2), when a bearing is used for operation at a constant speed; and, in terms of traveling distance (km), using equation (5-3), when a bearing is used in railway rolling stock or automobiles.

$$\left(\begin{array}{l} \text{Total} \\ \text{revolutions} \end{array} \right) L_{10} = \left(\frac{C}{P} \right)^p \quad \text{.....(5-1)}$$

$$\left(\begin{array}{l} \text{Time} \end{array} \right) L_{10h} = \frac{10^6}{60n} \left(\frac{C}{P} \right)^p \quad \text{.....(5-2)}$$

$$\left(\begin{array}{l} \text{Running} \\ \text{distance} \end{array} \right) L_{10s} = \pi D L_{10} \quad \text{.....(5-3)}$$

where :

L_{10} : basic rating life	10^6 revolutions
L_{10h} : basic rating life	h
L_{10s} : basic rating life	km
P : dynamic equivalent load	N
.....(refer to p. A 38.)	
C : basic dynamic load rating	N
n : rotational speed	min^{-1}
p : for ball bearings.....	$p = 3$
for roller bearings.....	$p = 10/3$
D : wheel or tire diameter	mm

Accordingly, where the dynamic equivalent load is P , and rotational speed is n , equation (5-4) can be used to calculate the basic dynamic load rating C ; the bearing size most suitable for a specified purpose can then be selected, referring to the bearing specification table.

The recommended bearing service life differs depending on the machines with which the bearing is used, as shown in Table 5-5, p. A 31.

$$C = P \left(L_{10h} \times \frac{60n}{10^6} \right)^{1/p} \quad \text{..... (5-4)}$$

[Reference]

The equations using a service life coefficient (f_h) and rotational speed coefficient (f_n) respectively, based on equation (5-2), are as follows :

$$L_{10h} = 500 f_h^p \quad \text{..... (5-5)}$$

Coefficient of service life :

$$f_h = f_n \frac{C}{P} \quad \text{..... (5-6)}$$

Coefficient of rotational speed :

$$f_n = \left(\frac{10^6}{500 \times 60n} \right)^{1/p} \\ = (0.03n)^{-1/p} \quad \text{..... (5-7)}$$

For reference, the values of f_n , f_h , and L_{10h} can be easily obtained by employing the nomograph attached to this catalog, as an abbreviated method.

[Ball bearing]

[Roller bearing]

[Reference] Rotational speed (n) and its coefficients (f_n), and service life coefficient (f_h) and basic rating life (L_{10h})

5-2-3 Correction of basic dynamic load rating for high temperature use and dimension stabilizing treatment

In high temperature operation, bearing material hardness deteriorates, as material compositions are altered. As a result, the basic dynamic load rating is diminished. Once altered, material composition is not recovered, even if operating temperatures return to normal.

Therefore, for bearings used in high temperature operation, the basic dynamic load rating should be corrected by multiplying the basic dynamic load rating values specified in the bearing specification table by the temperature coefficient values in Table 5-1.

Table 5-1 Temperature coefficient values

Bearing temperature, °C	125	150	175	200	250
Temperature coefficient	1	1	0.95	0.90	0.75

Since normal heat treatment is not effective in maintaining the original bearing size in extended operation at 120 °C or higher, dimension stabilizing treatment is necessary. Dimension stabilizing treatment codes and their effective temperature ranges are described in Table 5-2.

Since dimension stabilizing treatment diminishes material hardness, the basic dynamic load rating may be reduced for some types of bearings.

Table 5-2 Dimension stabilizing treatment

Dimension stabilizing treatment code	Effective temperature range
S0	Over 100°C, up to 150°C
S1	150°C 200°C
S2	200°C 250°C

5-2-4 Modified rating life L_{nm}

The life of rolling bearings was standardized as a basic rating life in the 1960s, but in actual applications, sometimes the actual life and the basic rating life have been quite different due to the lubrication status and the influence of the usage environment. To make the calculated life closer to the actual life, a corrected rating life has been considered since the 1980s. In this corrected rating life, bearing characteristic factor a_2 (a correction factor for the case in which the characteristics related to the life are changed due to the bearing materials, manufacturing process, and design) and usage condition factor a_3 (a correction factor that takes into account usage conditions that have a direct influence on the bearing life, such as the lubrication) or factor a_{23} formed from the interdependence of these two factors, are considered with the basic rating life. These factors were handled differently by each bearing manufacturer, but they have been standardized as a modified rating life in **ISO 281** in 2007. In 2013, **JIS B 1518** (dynamic load ratings and rating life) was amended to conform to the **ISO**.

The basic rating life (L_{10}) shown in equation (5-1) is the (fatigue) life with a dependability of 90 % under normal usage conditions for rolling bearings that have standard factors such as internal design, materials, and manufacturing quality. **JIS B 1518:2013** specifies a calculation method based on **ISO 281:2007**. To calculate accurate bearing life under a variety of operating conditions, it is necessary to consider elements such as the effect of changes in factors that can be anticipated when using different reliabilities and system approaches, and interactions between factors. Therefore, the specified calculation method considers additional stress due to the lubrication status, lubricant contamination, and fatigue load limit C_u (refer to p. A 29) on the inside of the bearing. The life that uses this life modification factor a_{ISO} , which considers the above factors, is called modified rating life L_{nm} and is calculated with the following equation (5-8).

$$L_{nm} = a_1 a_{ISO} L_{10} \quad (5-8)$$

In this equation,

L_{nm} : Modified rating life 10⁶ rotations
 [This rating life has been modified for one of or a combination of the following: reliability of 90 % or higher, fatigue load limit, special bearing characteristics, lubrication contamination, and special operating conditions.]

L_{10} : Basic rating life 10⁶ rotations (reliability: 90 %)

a_1 : Life modification factor for reliability refer to section (1)

a_{ISO} : Life modification factor refer to section (2)

[Remark]

When bearing dimensions are to be selected given L_{nm} greater than 90 % in reliability, the strength of shaft and housing must be considered.

(1) Life modification factor for reliability a_1

The term “reliability” is defined as “for a group of apparently identical rolling bearings, operating under the same conditions, the percentage of the group that is expected to attain or exceed a specified life” in **ISO 281:2007**. Values of a_1 used to calculate a modified rating life with a reliability of 90 % or higher (a failure probability of 10 % or less) are shown in Table 5-3.

Table 5-3 Life modification factor for reliability a_1

Reliability, %	L_{nm}	a_1
90	L_{10m}	1
95	L_{5m}	0.64
96	L_{4m}	0.55
97	L_{3m}	0.47
98	L_{2m}	0.37
99	L_{1m}	0.25
99.2	$L_{0.8m}$	0.22
99.4	$L_{0.6m}$	0.19
99.6	$L_{0.4m}$	0.16
99.8	$L_{0.2m}$	0.12
99.9	$L_{0.1m}$	0.093
99.92	$L_{0.08m}$	0.087
99.94	$L_{0.06m}$	0.080
99.95	$L_{0.05m}$	0.077

(Citation from **JIS B 1518:2013**)

(2) Life modification factor a_{ISO}

a) System approach

The various influences on bearing life are dependent on each other. The system approach of calculating the modified life has been evaluated as a practical method for determining life modification factor a_{ISO} (ref. Fig. 5-1). Life modification factor a_{ISO} is calculated with the following equation. A diagram is available for each bearing type (radial ball bearings, radial roller bearings, thrust ball bearings, and thrust roller bearings). (Each diagram (Figs. 5-2 to 5-5) is a citation from **JIS B 1518:2013**.)

Note that in practical use, this is set so that life modification factor $a_{ISO} \leq 50$.

$$a_{ISO} = f \left(\frac{e_c C_u}{P}, \kappa \right) \quad (5-9)$$

Fig. 5-1 System approach

Fig. 5-2 Life modification factor a_{ISO} (Radial ball bearings)

Fig. 5-3 Life modification factor a_{ISO} (Radial roller bearings)

Fig. 5-4 Life modification factor a_{ISO} (Thrust ball bearings)

Fig. 5-5 Life modification factor a_{ISO} (Thrust roller bearings)

(Figs. 5-2 to 5-5 Citation from JIS B 1518:2013)

b) Fatigue load limit C_u

For regulated steel materials or alloy steel that has equivalent quality, the fatigue life is unlimited so long as the load condition does not exceed a certain value and so long as the lubrication conditions, lubrication cleanliness class, and other operating conditions are favorable. For general high-quality materials and bearings with high manufacturing quality, the fatigue stress limit is reached at a contact stress of approximately 1.5 GPa between the raceway and rolling elements. If one or both of the material quality and manufacturing quality are low, the fatigue stress limit will also be low.

The term "fatigue load limit" C_u is defined as "bearing load under which the fatigue stress limit is just reached in the most heavily loaded raceway contact" in ISO 281:2007, and is affected by factors such as the bearing type, size, and material.

For details on the fatigue load limits of special bearings and other bearings not listed in this catalog, contact JTEKT.

c) Contamination factor e_c

If solid particles in the contaminated lubricant are caught between the raceway and the rolling elements, indentations may form on one or both of the raceway and the rolling elements. These indentations will lead to localized increases in stress, which will decrease the life. This decrease in life attributable to the contamination of the lubricant can be calculated from the contamination level as contamination factor e_c .

D_{pw} shown in this table is the pitch diameter of ball/roller set, which is expressed simply as $D_{pw} = (D + d)/2$. (D : Outside diameter, d : Bore diameter)

For information such as details on special lubricating conditions or detailed investigations, contact JTEKT.

Table 5-4 Values of contamination factor e_c

Contamination level	e_c	
	$D_{pw} < 100 \text{ mm}$	$D_{pw} \geq 100 \text{ mm}$
Extremely high cleanliness: The size of the particles is approximately equal to the thickness of the lubricant oil film, this is found in laboratory-level environments.	1	1
High cleanliness: The oil has been filtered by an extremely fine filter, this is found with standard grease-packed bearings and sealed bearings.	0.8 to 0.6	0.9 to 0.8
Standard cleanliness: The oil has been filtered by a fine filter, this is found with standard grease-packed bearings and shielded bearings.	0.6 to 0.5	0.8 to 0.6
Minimal contamination: The lubricant is slightly contaminated.	0.5 to 0.3	0.6 to 0.4
Normal contamination: This is found when no seal is used and a coarse filter is used in an environment in which wear debris and particles from the surrounding area penetrate into the lubricant.	0.3 to 0.1	0.4 to 0.2
High contamination: This is found when the surrounding environment is considerably contaminated and the bearing sealing is insufficient.	0.1 to 0	0.1 to 0
Extremely high contamination	0	0

(Table 5-4 Citation from JIS B 1518:2013)

d) Viscosity ratio κ

The lubricant forms an oil film on the roller contact surface, which separates the raceway and the rolling elements. The status of the lubricant oil film is expressed by viscosity ratio κ , the actual kinematic viscosity at the operating temperature ν divided by the reference kinematic viscosity ν_1 as shown in the following equation.

A κ greater than 4, equal to 4, or less than 0.1 is not applicable.

For details on lubricants such as grease and lubricants with extreme pressure additives, contact JTEKT.

$$\kappa = \frac{\nu}{\nu_1} \quad (5-10)$$

ν : Actual kinematic viscosity at the operating temperature; the viscosity of the lubricant at the operating temperature (refer to Fig. 12-3, p. A129)

ν_1 : Reference kinematic viscosity; determined according to the speed and pitch diameter of ball/roller set D_{pw} of the bearing (ref. Fig. 5-6)

(Fig. 5-6 Citation from JIS B 1518:2013)

Fig. 5-6 Reference kinematic viscosity v_1

5-2-5 Service life of bearing system comprising two or more bearings

Even for systems which comprise two or more bearings, if one bearing is damaged, the entire system malfunctions.

Where all bearings used in an application are regarded as one system, the service life of the bearing system can be calculated using the following equation,

$$\frac{1}{L^e} = \frac{1}{L_1^e} + \frac{1}{L_2^e} + \frac{1}{L_3^e} + \dots \quad (5-11)$$

where :

L : rating life of system

$L_1, L_2, L_3, \dots$: rating life of each bearing

e : constant

$\left(\begin{array}{l} e = 10/9 \dots \text{ball bearing} \\ e = 9/8 \dots \text{roller bearing} \\ \text{The mean value is for a system} \\ \text{using both ball and roller bearings.} \end{array} \right)$

[Example]

When a shaft is supported by two roller bearings whose service lives are 50 000 hours and 30 000 hours respectively, the rating life of the bearing system supporting this shaft is calculated as follows, using equation (5-11) :

$$\frac{1}{L^{9/8}} = \frac{1}{50\,000^{9/8}} + \frac{1}{30\,000^{9/8}}$$

$$L \doteq 20\,000 \text{ h}$$

The equation suggests that the rating life of these bearings as a system becomes shorter than that of the bearing with the shorter life.

This fact is very important in estimating bearing service life for applications using two or more bearings.

5-2-6 Applications and recommended bearing service life

Since longer service life does not always contribute to economical operation, the most suitable service life for each application and operating conditions should be determined.

For reference, Table 5-5 describes recommended service life in accordance with the application, as empirically determined.

Table 5-5 Recommended bearing service life (reference)

Operating condition	Application	Recommended service life (h)
Short or intermittent operation	Household electric appliance, electric tools, agricultural equipment, heavy cargo hoisting equipment	4 000 – 8 000
Not extended duration, but stable operation required	Household air conditioner motors, construction equipment, conveyors, elevators	8 000 – 12 000
Intermittent but extended operation	Rolling mill roll necks, small motors, cranes	8 000 – 12 000
	Motors used in factories, general gears	12 000 – 20 000
	Machine tools, shaker screens, crushers	20 000 – 30 000
	Compressors, pumps, gears for essential use	40 000 – 60 000
Daily operation more than 8 hr. or continuous extended operation	Escalators	12 000 – 20 000
	Centrifugal separators, air conditioners, air blowers, woodworking equipment, passenger coach axle journals	20 000 – 30 000
	Large motors, mine hoists, locomotive axle journals, railway rolling stock traction motors	40 000 – 60 000
	Paper manufacturing equipment	100 000 – 200 000
24 hr. operation (no failure allowed)	Water supply facilities, power stations, mine water discharge facilities	100 000 – 200 000

5-3 Calculation of loads

Loads affecting bearings includes force exerted by the weight of the object the bearings support, transmission force of devices such as gears and belts, loads generated in equipment during operation etc.

Seldom can these kinds of load be determined by simple calculation, because the load is not always constant.

In many cases, the load fluctuates, and it is difficult to determine the frequency and magnitude of the fluctuation.

Therefore, loads are normally obtained by multiplying theoretical values with various coefficients obtained empirically.

5-3-1 Load coefficient

Even if radial and axial loads are obtained through general dynamic calculation, the actual load becomes greater than the calculated value due to vibration and impact during operation.

In many cases, the load is obtained by multiplying theoretical values by the load coefficient.

Table 5-6 Values of load coefficient f_w

Operating condition	Application example	f_w
Operation with little vibration or impact	Motors Machine tools Measuring instrument	1.0 – 1.2
Normal operation (slight impact)	Railway rolling stock Automobiles Paper manufacturing equipment Air blowers Compressors Agricultural equipment	1.2 – 2.0
Operation with severe vibration or impact	Rolling mills Crushers Construction equipment Shaker screens	2.0 – 3.0

$$F = f_w \cdot F_c \quad \text{..... (5-12)}$$

where :

F : measured load N

F_c : calculated load N

f_w : load coefficient (ref. Table 5-6)

5-3-2 Load generated through belt or chain transmission

In the case of belt transmission, the theoretical value of the load affecting the pulley shafts can be determined by obtaining the effective transmission force of the belt.

For actual operation, the load is obtained by multiplying this effective transmission force by the load coefficient (f_w) considering vibration and impact generated during operation, and the belt coefficient (f_b) considering belt tension.

In the case of chain transmission, the load is determined using a coefficient equivalent to the belt coefficient.

This equation (5-13) is as follows ;

$$F_b = \frac{2M}{D_p} \cdot f_w \cdot f_b$$

$$= \frac{19.1 \times 10^6 W}{D_p n} \cdot f_w \cdot f_b \quad \text{..... (5-13)}$$

where :

F_b : estimated load affecting pulley shaft or sprocket shaft N

M : torque affecting pulley or sprocket mN · m

W : transmission force kW

D_p : pitch circle diameter of pulley or sprocket mm

n : rotational speed min⁻¹

f_w : load coefficient (ref. Table 5-6)

f_b : belt coefficient (ref. Table 5-7)

Table 5-7 Values of belt coefficient f_b

Belt type	f_b
Timing belt (with teeth)	1.3 – 2.0
V-belt	2.0 – 2.5
Flat belt (with tension pulley)	2.5 – 3.0
Flat belt	4.0 – 5.0
Chain	1.2 – 1.5

5-3-3 Load generated under gear transmission

(1) Loads affecting gear and gear coefficient

In the case of gear transmission, loads transmitted by gearing are theoretically classified into three types: tangential load (K_t), radial load (K_r) and axial load (K_a).

Those loads can be calculated dynamically (using equations ①, ② and ③, described in section (2)).

To determine the actual gear loads, these theoretical loads must be multiplied by coefficients considering vibration and impact during operation (f_w) (ref. Table 5-6) and the gear coefficient (f_g) (ref. Table 5-8) considering the finish treatment of gears.

Table 5-8 Values of gear coefficient f_g

Gear type	f_g
Precision gears (both pitch error and tooth shape error less than 0.02 mm)	1.0 – 1.1
Normal gears (both pitch error and tooth shape error less than 0.1 mm)	1.1 – 1.3

(2) Calculation of load on gears

① Tangential load (tangential force) K_t
$\left(\begin{array}{l} \text{Spur gears, helical gears, double-helical gears,} \\ \text{straight bevel gears, spiral bevel gears} \end{array} \right)$ $K_t = \frac{2M}{D_p} = \frac{19.1 \times 10^6 \text{ W}}{D_p n} \dots\dots\dots (5-14)$

①~③ where :

K_t : gear tangential load	N
K_r : gear radial load	N
K_a : gear axial load	N
M : torque affecting gears	mN · m
D_p : gear pitch circle diameter	mm
W : transmitting force	kW
n : rotational speed	min ⁻¹
α : gear pressure angle	deg
β : gear helix (spiral) angle	deg
δ : bevel gear pitch angle	deg

Fig. 5-7 Load on spur gears

Fig. 5-8 Load on helical gears

	② Radial load (separating force) K_r	③ Axial load (axial force) K_a
Spur gears	$K_r = K_t \tan \alpha \dots\dots\dots (5-15)$	0
Helical gears	$K_r = K_t \frac{\tan \alpha}{\cos \beta} \dots\dots\dots (5-16)$	$K_a = K_t \tan \beta \dots\dots\dots (5-22)$
Double-helical gears	$K_r = K_t \frac{\tan \alpha}{\cos \beta} \dots\dots\dots (5-17)$	0
Straight ¹⁾ bevel gears	Drive side $K_{r1} = K_t \tan \alpha \cos \delta_1 \dots\dots\dots (5-18)$	$K_{a1} = K_t \tan \alpha \sin \delta_1 \dots\dots\dots (5-23)$
	Driven side $K_{r2} = K_t \tan \alpha \cos \delta_2 \dots\dots\dots (5-19)$	$K_{a2} = K_t \tan \alpha \sin \delta_2 \dots\dots\dots (5-24)$
Spiral ^{1), 2)} bevel gears	Drive side $K_{r1} = \frac{K_t}{\cos \beta} (\tan \alpha \cos \delta_1 \pm \sin \beta \sin \delta_1) \dots\dots\dots (5-20)$	$K_{a1} = \frac{K_t}{\cos \beta} (\tan \alpha \sin \delta_1 \mp \sin \beta \cos \delta_1) \dots\dots\dots (5-25)$
	Driven side $K_{r2} = \frac{K_t}{\cos \beta} (\tan \alpha \cos \delta_2 \mp \sin \beta \sin \delta_2) \dots\dots\dots (5-21)$	$K_{a2} = \frac{K_t}{\cos \beta} (\tan \alpha \sin \delta_2 \pm \sin \beta \cos \delta_2) \dots\dots\dots (5-26)$

[Notes] 1) Codes with subscript 1 and 2 shown in equations are respectively applicable to drive side gears and driven side gears.

2) Symbols (+) and (-) denote the following ;

Symbols in upper row : clockwise rotation accompanied by right-handed spiral or counterclockwise rotation with left-handed spiral
 Symbols in lower row : counterclockwise rotation with right-handed spiral or clockwise rotation with left-handed spiral

[Remark] Rotating directions are described as viewed at the back of the apex of the pitch angle.

Fig. 5-9 Load on straight bevel gears

Fig. 5-10 Load on spiral bevel gears

5-3-4 Load distribution on bearings

The load distribution affecting bearings can be calculated as follows: first, radial force components are calculated, then, the sum of vectors of the components is obtained in accordance with the load direction.

Calculation examples of radial load distribution are described in the following section.

[Remark]

Bearings shown in Exs. 3 to 5 are affected by components of axial force when these bearings accommodate radial load, and axial load (K_a) which is transferred externally, i.e. from gears.

For calculation of the axial load in this case, refer to page A 38.

Example 1 Fundamental calculation (1)

$$F_{rA} = \frac{b}{c} K$$

$$F_{rB} = \frac{a}{c} K$$

..... (5-27)

Example 2 Fundamental calculation (2)

$$F_{rA} = \frac{b}{c} K$$

$$F_{rB} = \frac{a}{c} K$$

..... (5-28)

Example 3 Gear load distribution (1)

$$F_{rA} = \sqrt{\left(\frac{b}{c} K_t\right)^2 + \left(\frac{b}{c} K_r - \frac{D_p}{2c} K_a\right)^2}$$

$$F_{rB} = \sqrt{\left(\frac{a}{c} K_t\right)^2 + \left(\frac{a}{c} K_r + \frac{D_p}{2c} K_a\right)^2}$$

..... (5-29)

Example 4 Gear load distribution (2)

$$F_{rA} = \sqrt{\left(\frac{b}{c} K_t\right)^2 + \left(\frac{b}{c} K_r - \frac{D_p}{2c} K_a\right)^2}$$

$$F_{rB} = \sqrt{\left(\frac{a}{c} K_t\right)^2 + \left(\frac{a}{c} K_r - \frac{D_p}{2c} K_a\right)^2}$$

..... (5-30)

Description of signs in Examples 1 to 5

F_{rA} : radial load on bearing A	N	D_p : gear pitch circle diameter	mm
F_{rB} : radial load on bearing B	N	⊙: denotes load direction (upward	
K : shaft load	N	perpendicular to paper surface)	
K_t, K_r, K_a : gear load	N	⊗: denotes load direction (downward

Example 5 Simultaneous application of gear load and other load

(Gears 1 and 2 are engaged with each other at angle θ . External load F , moment M , are applied to these gears at angles θ_1 and θ_2 .)

- Perpendicular radial component force (upward and downward along diagram)

$$F_{rAV} = \frac{b}{c} (K_r \cos \theta + K_t \sin \theta) - \frac{D_p}{2c} K_a \cos \theta + \frac{m}{c} F \cos \theta_1 - \frac{M}{c} \cos \theta_2$$

$$F_{rBV} = \frac{a}{c} (K_r \cos \theta + K_t \sin \theta) + \frac{D_p}{2c} K_a \cos \theta + \frac{e}{c} F \cos \theta_1 + \frac{M}{c} \cos \theta_2$$

- Horizontal radial component force (upward and downward perpendicular to diagram)

$$F_{rAH} = \frac{b}{c} (K_r \sin \theta - K_t \cos \theta) - \frac{D_p}{2c} K_a \sin \theta + \frac{m}{c} F \sin \theta_1 - \frac{M}{c} \sin \theta_2$$

$$F_{rBH} = \frac{a}{c} (K_r \sin \theta - K_t \cos \theta) + \frac{D_p}{2c} K_a \sin \theta + \frac{e}{c} F \sin \theta_1 + \frac{M}{c} \sin \theta_2$$

- Combined radial force

$$F_{rA} = \sqrt{F_{rAV}^2 + F_{rAH}^2}$$

$$F_{rB} = \sqrt{F_{rBV}^2 + F_{rBH}^2}$$

..... (5-31) (When θ , F , and M are zero, the same result as in Ex. 3 is obtained)

5-4 Dynamic equivalent load

Bearings are used under various operating conditions; however, in most cases, bearings receive radial and axial load combined, while the load magnitude fluctuates during operation.

Therefore, it is impossible to directly compare the actual load and basic dynamic load rating.

The two are compared by replacing the loads applied to the shaft center with one of a constant magnitude and in a specific direction, that yields the same bearing service life as under actual load and rotational speed.

This theoretical load is referred to as the dynamic equivalent load (P).

5-4-1 Calculation of dynamic equivalent load

Dynamic equivalent loads for radial bearings and thrust bearings ($\alpha \neq 90^\circ$) which receive a combined load of a constant magnitude in a specific direction can be calculated using the following equation,

$$P = XF_r + YF_a \quad (5-32)$$

where :

P : dynamic equivalent load N
 (for radial bearings,
 P_r : dynamic equivalent radial load
 for thrust bearings,
 P_a : dynamic equivalent axial load)
 F_r : radial load N
 F_a : axial load N
 X : radial load factor
 Y : axial load factor

(values of X and Y are listed in the bearing specification table.)

■ When $F_a/F_r \leq e$ for single-row radial bearings, it is taken that $X = 1$, and $Y = 0$. Hence, the dynamic equivalent load rating is $P_r = F_r$.

(Values of e , which designates the limit of F_a/F_r , are listed in the bearing specification table.)

■ For single-row angular contact ball bearings and tapered roller bearings, axial component forces (F_{ac}) are generated as shown in Fig. 5-11, therefore a pair of bearings is arranged face-to-face or back-to-back.

The axial component force can be calculated using the following equation.

$$F_{ac} = \frac{F_r}{2Y} \quad (5-33)$$

Table 5-9 describes the calculation of the dynamic equivalent load when radial loads and external axial loads (K_a) are applied to bearings.

Fig. 5-11 Axial component force

■ For thrust ball bearings with contact angle $\alpha = 90^\circ$, to which an axial load is applied, $P_a = F_a$.

■ The dynamic equivalent load of spherical thrust roller bearing can be calculated using the following equation.

$$P_a = F_a + 1.2F_r \quad (5-34)$$

where : $F_r/F_a \leq 0.55$

Table 5-9 Dynamic equivalent load calculation : when a pair of single-row angular contact ball bearings or tapered roller bearings is arranged face-to-face or back-to-back.

Paired mounting		Loading condition	Bearing	Axial load	Dynamic equivalent load
Back-to-back arrangement	Face-to-face arrangement				
		$\frac{F_{rB}}{2Y_B} + K_a \geq \frac{F_{rA}}{2Y_A}$	Bearing A	$\frac{F_{rB}}{2Y_B} + K_a$	$P_A = XF_{rA} + Y_A \left(\frac{F_{rB}}{2Y_B} + K_a \right)$ $P_A = F_{rA}$, where $P_A < F_{rA}$
			Bearing B	—	$P_B = F_{rB}$
		$\frac{F_{rB}}{2Y_B} + K_a < \frac{F_{rA}}{2Y_A}$	Bearing A	—	$P_A = F_{rA}$
			Bearing B	$\frac{F_{rA}}{2Y_A} - K_a$	$P_B = XF_{rB} + Y_B \left(\frac{F_{rA}}{2Y_A} - K_a \right)$ $P_B = F_{rB}$, where $P_B < F_{rB}$
		$\frac{F_{rB}}{2Y_B} \leq \frac{F_{rA}}{2Y_A} + K_a$	Bearing A	—	$P_A = F_{rA}$
			Bearing B	$\frac{F_{rA}}{2Y_A} + K_a$	$P_B = XF_{rB} + Y_B \left(\frac{F_{rA}}{2Y_A} + K_a \right)$ $P_B = F_{rB}$, where $P_B < F_{rB}$
		$\frac{F_{rB}}{2Y_B} > \frac{F_{rA}}{2Y_A} + K_a$	Bearing A	$\frac{F_{rB}}{2Y_B} - K_a$	$P_A = XF_{rA} + Y_A \left(\frac{F_{rB}}{2Y_B} - K_a \right)$ $P_A = F_{rA}$, where $P_A < F_{rA}$
			Bearing B	—	$P_B = F_{rB}$

[Remarks] 1. These equations can be used when internal clearance and preload during operation are zero.
 2. Radial load is treated as positive in the calculation, if it is applied in a direction opposite to that shown in Fig. in Table 5-9.

5-4-2 Mean dynamic equivalent load

When load magnitude or direction varies, it is necessary to calculate the mean dynamic equivalent load, which provides the same length of bearing service life as that under the actual load fluctuation.

The mean dynamic equivalent load (P_m) under different load fluctuations is described using Graphs (1) to (4).

As shown in Graph (5), the mean dynamic equivalent load under stationary and rotating load applied simultaneously, can be obtained using equation (5-39).

(1) Staged fluctuation	(2) Stageless fluctuation	(3) Fluctuation forming sine curve	(4) Fluctuation forming sine curve (upper half of sine curve)
$P_m = \sqrt[p]{\frac{P_1^p n_1 t_1 + P_2^p n_2 t_2 + \dots + P_n^p n_n t_n}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}} \quad \dots (5-35)$	$P_m = \frac{P_{\min} + 2 P_{\max}}{3} \quad \dots (5-36)$	$P_m = 0.68 P_{\max} \quad \dots (5-37)$	$P_m = 0.75 P_{\max} \quad \dots (5-38)$

Symbols for Graphs (1) to (4)

P_m	: mean dynamic equivalent load	N
P_1	: dynamic equivalent load applied for t_1 hours at rotational speed n_1	N
P_2	: dynamic equivalent load applied for t_2 hours at rotational speed n_2	N
$\vdots$	$\vdots$	$\vdots$
P_n	: dynamic equivalent load applied for t_n hours at rotational speed n_n	N
$P_{\min}$	: minimum dynamic equivalent load	N
$P_{\max}$	: maximum dynamic equivalent load	N
$\Sigma n_i t_i$	: total rotation in (t_1 to t_i) hours	
p	: for ball bearings, $p = 3$	
	for roller bearings, $p = 10/3$	

[Reference] Mean rotational speed n_m can be calculated using the following equation :

$$n_m = \frac{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}{t_1 + t_2 + \dots + t_n}$$

(5) Stationary load and rotating load acting simultaneously

$$P_m = f_m (P + P_u) \quad \dots (5-39)$$

Fig. 5-12 Coefficient f_m

where :

P_m	: mean dynamic equivalent load	N
f_m	: coefficient (refer. Fig. 5-12)	
P	: stationary load	N
P_u	: rotating load	N

5-5 Basic static load rating and static equivalent load

5-5-1 Basic static load rating

Excessive static load or impact load even at very low rotation speed causes partial permanent deformation of the rolling element and raceway contacting surfaces. This permanent deformation increases with the load; if it exceeds a certain limit, smooth rotation will be hindered.

The basic static load rating is the static load which responds to the calculated contact stress shown below, at the contact center between the raceway and rolling elements which receive the maximum load.

- Self-aligning ball bearings ... 4 600 MPa
- Other ball bearings 4 200 MPa
- Roller bearings 4 000 MPa

The total extent of contact stress-caused permanent deformation on surfaces of rolling elements and raceway will be approximately 0.000 1 times greater than the rolling element diameter.

The basic static load rating for radial bearings is specified as the basic static radial load rating, and for thrust bearings, as the basic static axial load rating. These load ratings are listed in the bearing specification table, using C_{0r} and C_{0a} respectively.

These values are prescribed by ISO 78/1987 and are subject to change by conformance to the latest ISO standards.

5-5-2 Static equivalent load

The static equivalent load is a theoretical load calculated such that, during rotation at very low speed or when bearings are stationary, the same contact stress as that imposed under actual loading condition is generated at the contact center between raceway and rolling element to which the maximum load is applied.

For radial bearings, radial load passing through the bearing center is used for the calculation; for thrust bearings, axial load in a direction along the bearing axis is used.

The static equivalent load can be calculated using the following equations.

[Radial bearings]

...The greater value obtained by the following two equations is used.

$$P_{0r} = X_0 F_r + Y_0 F_a \quad (5-40)$$

$$P_{0r} = F_r \quad (5-41)$$

[Thrust bearings]

($\alpha \neq 90^\circ$)

$$P_{0a} = X_0 F_r + F_a \quad (5-42)$$

[When $F_a < X_0 F_r$,
the solution becomes less accurate.]

($\alpha = 90^\circ$)

$$P_{0a} = F_a \quad (5-43)$$

where :

P_{0r} : static equivalent radial load N

P_{0a} : static equivalent axial load N

F_r : radial load N

F_a : axial load N

X_0 : static radial load factor

Y_0 : static axial load factor
(values of X_0 and Y_0 are listed in the bearing specification table.)

5-5-3 Safety coefficient

The allowable static equivalent load for a bearing is determined by the basic static load rating of the bearing; however, bearing service life, which is affected by permanent deformation, differs in accordance with the performance required of the bearing and operating conditions.

Therefore, a safety coefficient is designated, based on empirical data, so as to ensure safety in relation to basic static load rating.

$$f_s = \frac{C_0}{P_0} \quad (5-44)$$

where :

f_s : safety coefficient (ref. Table 5-10)

C_0 : basic static load rating N

P_0 : static equivalent load N

Table 5-10 Values of safety coefficient f_s

Operating condition		f_s (min.)	
		Ball bearing	Roller bearing
With bearing rotation	When high accuracy is required	2	3
	Normal operation	1	1.5
	When impact load is applied	1.5	3
Without bearing rotation (occasional oscillation)	Normal operation	0.5	1
	When impact load or uneven distribution load is applied	1	2

[Remark] For spherical thrust roller bearings, $f_s \geq 4$.

5-6 Allowable axial load for cylindrical roller bearings

Bearings whose inner and outer rings comprise either a rib or loose rib can accommodate a certain magnitude of axial load, as well as radial load. In such cases, axial load capacity is controlled by the condition of rollers, load capacity of rib or loose rib, lubrication, rotational speed etc.

For certain special uses, a design is available to accommodate very heavy axial loads. In general, axial loads allowable for cylindrical roller bearings can be calculated using the following equation, which are based on empirical data.

$$F_{ap} = 9.8 f_a \cdot f_b \cdot f_p \cdot d_m^2 \quad \text{..... (5-45)}$$

where :

F_{ap} : maximum allowable axial load N

f_a : coefficient determined from
loading condition (Table 5-11)

f_b : coefficient determined from
bearing diameter series (Table 5-12)

f_p : coefficient for rib surface pressure
(Fig. 5-13)

d_m : mean value of bore diameter d and
outside diameter D mm

$$\left(\frac{d + D}{2} \right)$$

Table 5-11 Values of coefficient determined from loading condition f_a

Loading condition	f_a
Continuous loading	1

[Example 1] Bearing service life (time) with 90 % reliability	[Example 2] Bearing service life (time) with 90 % reliability
(Conditions) Deep groove ball bearing : 6308 Radial load $F_r = 3\,500\text{ N}$ Axial load not applied ($F_a = 0$) Rotational speed $n = 800\text{ min}^{-1}$ 	(Conditions) Deep groove ball bearing : 6308 Radial load $F_r = 3\,500\text{ N}$ Axial load $F_a = 1\,000\text{ N}$ Rotational speed $n = 800\text{ min}^{-1}$ 
① Basic dynamic load rating (C_r) is obtained from the bearing specification table. $C_r = 50.9\text{ kN}$ ② Dynamic equivalent radial load (P_r) is calculated using equation (5-32). $P_r = F_r = 3\,500\text{ N}$ ③ Bearing service life (L_{10h}) is calculated using equation (5-2). $L_{10h} = \frac{10^6}{60n} \left(\frac{C}{P} \right)^p$ $= \frac{10^6}{60 \times 800} \times \left(\frac{50.9 \times 10^3}{3\,500} \right)^3 \div 64\,100\text{ h}$	① From the bearing specification table ; - Basic load rating (C_r, C_{0r}) f_0 factor is obtained. $C_r = 50.9\text{ kN}$ $C_{0r} = 24.0\text{ kN}$ $f_0 = 13.2$ - Values X and Y are obtained by comparing value e, calculated from value $f_0 F_a / C_{0r}$ via proportional interpolation, with value $f_0 F_a / F_r$. $\frac{f_0 F_a}{C_{0r}} = \frac{13.2 \times 1\,000}{24.0 \times 10^3} = 0.550$ $e = 0.22 + (0.26 - 0.22) \times \frac{(0.550 - 0.345)}{(0.689 - 0.345)}$ $= 0.24$ $\frac{F_a}{F_r} = \frac{1\,000}{3\,500} = 0.29 > e$ The result is, $X = 0.56$ $Y = 1.99 - (1.99 - 1.71) \times \frac{(0.550 - 0.345)}{(0.689 - 0.345)}$ $= 1.82$ ② Dynamic equivalent load (P_r) is obtained using equation (5-32). $P_r = XF_r + YF_a$ $= (0.56 \times 3\,500) + (1.82 \times 1\,000) = 3\,780\text{ N}$ ③ Service life with 90 % reliability (L_{10h}) is obtained using equation (5-2). $L_{10h} = \frac{10^6}{60n} \left(\frac{C}{P} \right)^p$ $= \frac{10^6}{60 \times 800} \times \left(\frac{50.9 \times 10^3}{3\,780} \right)^3 \div 50\,900\text{ h}$

[Example 3] Calculation of the a_{ISO} factor with the conditions in Example 2
(Conditions) Oil lubrication (Oil that has been filtered by a fine filter) Operating temperature $70\text{ }^\circ\text{C}$ 96 % reliability ④ Lubricating oil selection From the bearing specification table, the pitch diameter of ball/roller set $D_{pw} = (40 + 90)/2 = 65$ is obtained. $d_{mn} = 65 \times 800 = 52\,000$. Therefore, select VG 68 from Table 12-8, p. A 129. ⑤ Calculating the a_{ISO} factor The operating temperature is $70\text{ }^\circ\text{C}$, so according to Fig. 12-3, p. A 129, the kinematic viscosity when operating is $\nu = 20\text{ mm}^2/\text{s}$ According to Fig. A, $\nu_1 = 21.7\text{ mm}^2/\text{s}$ $\kappa = \nu/\nu_1 = 20/21.7 = 0.92$ The oil has been filtered by a fine filter, so Table 5-4 shows e_c is 0.5 to 0.6. To stringently estimate the value, $e_c = 0.5$. $\frac{e_c \cdot C_u}{P} = \frac{0.5 \times 1\,850}{3\,780} = 0.24$ Therefore, according to Fig. B $a_{ISO} = 7.7$ ⑥ Service life with 96 % reliability (L_{nm}) is obtained using equation (5-8). According to Table 5-3, $a_1 = 0.55$. $L_{4m} = a_1 a_{ISO} L_{10} = 0.55 \times 7.7 \times 50\,900 \div 216\,000\text{ h}$  Fig. A  Fig. B

The a_{ISO} factor can also be calculated on our website.

[Example 4] Bearing service life (total revolution)

(Conditions)

Tapered roller bearing

Bearing A : 30207 JR

Bearing B : 30209 JR

Radial load $F_{rA} = 5\,200\text{ N}$ $F_{rB} = 6\,800\text{ N}$ Axial load $K_a = 1\,600\text{ N}$ 

- ① From the bearing specification table, the following specifications are obtained.

	Basic dynamic load rating (C_r)	e	$X^{(1)}$	$Y^{(1)}$
Bearing A	68.8 kN	0.37	0.4	1.60
Bearing B	83.9 kN	0.40	0.4	1.48

[Note] 1) Those values are used, where $F_a/F_r > e$.

Where $F_a/F_r \leq e$, $X = 1$, $Y = 0$.

- ② Axial load applied to shafts must be calculated, considering the fact that component force in the axial direction is generated when radial load is applied to tapered roller bearings. (ref. equation 5-33, Table 5-9)

$$\frac{F_{rA}}{2 Y_A} + K_a = \frac{5\,200}{2 \times 1.60} + 1\,600 = 3\,225\text{ N}$$

$$\frac{F_{rB}}{2 Y_B} = \frac{6\,800}{2 \times 1.48} = 2\,297\text{ N}$$

Consequently, axial load $\frac{F_{rA}}{2 Y_A} + K_a$ is applied to bearing B.

- ③ Dynamic equivalent load (P_r) is obtained from Table 5-9.

$$P_{rA} = F_{rA} = 5\,200\text{ N}$$

$$P_{rB} = XF_{rB} + Y_B \left(\frac{F_{rA}}{2 Y_A} + K_a \right)$$

$$= 0.4 \times 6\,800 + 1.48 \times 3\,225 = 7\,493\text{ N}$$

- ④ Each bearing service life (L_{10}) is calculated using equation (5-1).

$$L_{10A} = \left(\frac{C_{rA}}{P_{rA}} \right)^{10/3} = \left(\frac{68.8 \times 10^3}{5\,200} \right)^{10/3} \\ \doteq 5\,480 \times 10^6 \text{ revolutions}$$

$$L_{10B} = \left(\frac{C_{rB}}{P_{rB}} \right)^{10/3} = \left(\frac{83.9 \times 10^3}{7\,493} \right)^{10/3} \\ \doteq 3\,140 \times 10^6 \text{ revolutions}$$

[Example 5] Bearing size selection

(Conditions)

Deep groove ball bearing :

62 series

Required service life :

more than 10 000 h

Radial load $F_r = 2\,000\text{ N}$ Axial load $F_a = 300\text{ N}$ Rotational speed $n = 1\,600\text{ min}^{-1}$ 

- ① The dynamic equivalent load (P_r) is hypothetically calculated.

The resultant value, $F_a/F_r = 300/2\,000 = 0.15$, is smaller than any other values of e in the bearing specification table.

Hence, JTEKT can consider that $P_r = F_r = 2\,000\text{ N}$.

- ② The required basic dynamic load rating (C_r) is calculated according to equation (5-4).

$$C_r = P_r \left(L_{10h} \times \frac{60n}{10^6} \right)^{1/p} \\ = 2\,000 \times \left(10\,000 \times \frac{60 \times 1\,600}{10^6} \right)^{1/3} \\ = 19\,730\text{ N}$$

- ③ Among those covered by the bearing specification table, the bearing of the 62 series with C_r exceeding 19 730 N is 6205 R, with bore diameter for 25 mm.

- ④ The dynamic equivalent load obtained at step ① is confirmed by obtaining value e for 6205 R.

Where C_{0r} of 6205 R is 9.3 kN, and f_0 is 12.8

$$f_0 F_a / C_{0r} = 12.8 \times 300 / 9\,300 = 0.413$$

Then, value e can be calculated using proportional interpolation.

$$e = 0.22 + (0.26 - 0.22) \times \frac{(0.413 - 0.345)}{(0.689 - 0.345)} \\ = 0.23$$

As a result, it can be confirmed that

$$F_a / F_r = 0.15 < e.$$

Hence, $P_r = F_r$.

[Example 6] Bearing size selection

(Conditions)

Deep groove ball bearing :

63 series

Required service life :

more than 15 000 h

Radial load $F_r = 4\,000\text{ N}$ Axial load $F_a = 2\,400\text{ N}$ Rotational speed $n = 1\,000\text{ min}^{-1}$ 

- ① The hypothetical dynamic equivalent load (P_r) is calculated :

Since $F_a/F_r = 2\,400/4\,000 = 0.6$ is much larger than the value e specified in the bearing specification table, it suggests that the axial load affects the dynamic equivalent load.

Hence, assuming that $X = 0.56$, $Y = 1.6$

(approximate mean value of Y), using equation (5-32), $P_r = XF_r + YF_a = 0.56 \times 4\,000 + 1.6 \times 2\,400 = 6\,080\text{ N}$

- ② Using equation (5-4), the required basic dynamic load rating (C_r) is :

$$C_r = P_r \left(L_{10h} \times \frac{60n}{10^6} \right)^{1/p} \\ = 6\,080 \times \left(15\,000 \times \frac{60 \times 1\,000}{10^6} \right)^{1/3} \\ = 58\,700\text{ N}$$

- ③ From the bearing specification table, a 6309 with a bore diameter of 45 mm is selected as a 63 series bearing with C_r exceeding 58 700 N.

- ④ The dynamic equivalent load and basic rating life are confirmed, by calculating the value e for a 6309. Values obtained using the proportional interpolation are :

$$\text{where } f_0 F_a / C_{0r} = 13.3 \times 2\,400 / 29\,500 = 1.082$$

$$e = 0.283, Y = 1.54.$$

$$\text{Thus, } F_a/F_r = 0.6 > e.$$

Using the resultant values, the dynamic equivalent load and basic rating life can be calculated as follows :

$$P_r = XF_r + YF_a \\ = 0.56 \times 4\,000 + 1.54 \times 2\,400 = 5\,940\text{ N}$$

$$L_{10h} = \frac{10^6}{60n} \left(\frac{C_r}{P_r} \right)^p \\ = \frac{10^6}{60 \times 1\,000} \times \left(\frac{61.1 \times 10^3}{5\,940} \right)^3 \doteq 18\,100\text{ h}$$

- ⑤ The basic rating life of the 6308, using the same steps, is :

$$L_{10h} \doteq 11\,500\text{ h, which does not satisfy the service life requirement.}$$

[Example 7] Calculation of allowable axial load for cylindrical roller bearings

(Conditions)

Single-row cylindrical roller bearing : NUP 310

Rotational speed $n = 1\,500\text{ min}^{-1}$

Oil lubrication

Axial load is intermittently applied.

- ① Using the bearing specification table, the value d_m for the NUP 310 can be calculated as follows :

$$d_m = \frac{d + D}{2} = \frac{50 + 110}{2} = 80\text{ mm}$$

- ② Each coefficient used in equation (5-45).

From values listed in Table 5-11, coefficient f_a related to intermittent load is : $f_a = 2$

From values listed in Table 5-12, coefficient f_b related to diameter series 3 is : $f_b = 1.0$

According to Fig. 5-13, coefficient f_p for allowable rib surface pressure, related to $d_m n = 80 \times 1\,500 = 12 \times 10^4$, is : $f_p = 0.062$

- ③ Using equation (5-45), the allowable axial load F_{ap} is :

$$F_{ap} = 9.8 f_a \cdot f_b \cdot f_p \cdot d_m^2 \\ = 9.8 \times 2 \times 1.0 \times 0.062 \times 80^2 \\ \doteq 7\,780\text{ N}$$

[Example 8] Calculation of service life of spur gear shaft bearings

(Conditions)

Tapered roller bearing

Bearing A : 32309 JR

Bearing B : 32310 JR

Gear type : spur gear (normally machined)

Gear pressure angle $\alpha_1 = \alpha_2 = 20^\circ$ Gear pitch circle diameter $D_{p1} = 360$ mm $D_{p2} = 180$ mmTransmission power $W = 150$ kWRotational speed $n = 1\,000$ min⁻¹

Operating condition: accompanied by impact

Installation locations

 $a_1 = 95$ mm, $a_2 = 265$ mm, $b_1 = 245$ mm, $b_2 = 115$ mm, $c = 360$ mm

- ① Using equations (5-14) and (5-15), theoretical loads applied to gears (tangential load, K_t ; radial load, K_r) are calculated.

[Gear 1]

$$K_{t1} = \frac{19.1 \times 10^6 W}{D_p n} = \frac{19.1 \times 10^6 \times 150}{360 \times 1\,000} = 7\,958 \text{ N}$$

$$K_{r1} = K_{t1} \tan \alpha_1 = 2\,896 \text{ N}$$

[Gear 2]

$$K_{t2} = \frac{19.1 \times 10^6 \times 150}{180 \times 1\,000} = 15\,917 \text{ N}$$

$$K_{r2} = K_{t2} \tan \alpha_2 = 5\,793 \text{ N}$$

- ② The radial load applied to the bearing is calculated, where the load coefficient is determined as $f_w = 1.5$ from Table 5-6, and the gear coefficient as $f_g = 1.2$ from Table 5-8.

[Bearing A]

- Load consisting of K_{t1} and K_{t2} is :

$$K_{tA} = f_w f_g \left(\frac{a_2}{c} K_{t1} + \frac{b_2}{c} K_{t2} \right) = 1.5 \times 1.2 \times \left(\frac{265}{360} \times 7\,958 + \frac{115}{360} \times 15\,917 \right) = 19\,697 \text{ N}$$

- Load consisting of K_{r1} and K_{r2} is :

$$K_{rA} = f_w f_g \left(\frac{a_2}{c} K_{r1} - \frac{b_2}{c} K_{r2} \right) = 1.5 \times 1.2 \times \left(\frac{265}{360} \times 2\,896 - \frac{115}{360} \times 5\,793 \right) = 506 \text{ N}$$

- Combining the loads of K_{tA} and K_{rA} , the radial load (F_{rA}) applied to bearing A can be calculated as follows :

$$F_{rA} = \sqrt{K_{tA}^2 + K_{rA}^2} = \sqrt{19\,697^2 + 506^2} = 19\,703 \text{ N}$$

[Bearing B]

- Load consisting of K_{t1} and K_{t2} is :

$$K_{tB} = f_w f_g \left(\frac{a_1}{c} K_{t1} + \frac{b_1}{c} K_{t2} \right) = 1.5 \times 1.2 \times \left(\frac{95}{360} \times 7\,958 + \frac{245}{360} \times 15\,917 \right) = 23\,278 \text{ N}$$

- Load consisting of K_{r1} and K_{r2} is :

$$K_{rB} = f_w f_g \left(\frac{a_1}{c} K_{r1} - \frac{b_1}{c} K_{r2} \right) = 1.5 \times 1.2 \times \left(\frac{95}{360} \times 2\,896 - \frac{245}{360} \times 5\,793 \right) = -5\,721 \text{ N}$$

- The radial load (F_{rB}) applied to bearing B can be calculated using the same steps as with bearing A.

$$F_{rB} = \sqrt{K_{tB}^2 + K_{rB}^2} = \sqrt{23\,278^2 + (-5\,721)^2} = 23\,971 \text{ N}$$

- ③ The following specifications can be obtained from the bearing specification table.

	Basic dynamic load rating (C_r)	e	$X^{(1)}$	$Y^{(1)}$
Bearing A	183 kN	0.35	0.4	1.74
Bearing B	221 kN			

[Note] 1) Those values are used, where $F_a/F_r > e$.
Where $F_a/F_r \leq e$, $X = 1$, $Y = 0$.

- ④ When an axial load is not applied externally, if the radial load is applied to the tapered roller bearing, an axial component force is generated.

Considering this fact, the axial load applied from the shaft and peripheral parts is to be calculated :

(Equation 5-33, Table 5-9)

$$\frac{F_{rB}}{2 Y_B} = \frac{23\,971}{2 \times 1.74} > \frac{F_{rA}}{2 Y_A} = \frac{19\,703}{2 \times 1.74}$$

According to the result, it is clear that the axial component force ($F_{rB}/2Y_B$) applied to bearing B is also applied to bearing A as an axial load applied from the shaft and peripheral parts.

- ⑤ Using the values listed in Table 5-9, the dynamic equivalent load is calculated, where $K_a = 0$:

$$\begin{aligned} P_{rA} &= X F_{rA} + Y_A \frac{F_{rB}}{2 Y_B} \\ &= 0.4 \times 19\,703 + 1.74 \times \frac{23\,971}{2 \times 1.74} \\ &= 19\,867 \text{ N} \\ P_{rB} &= F_{rB} = 23\,971 \text{ N} \end{aligned}$$

- ⑥ Using equation (5-2), the basic rating life of each bearing is calculated :

[Bearing A]

$$\begin{aligned} L_{10hA} &= \frac{10^6}{60n} \left(\frac{C_{rA}}{P_A} \right)^p \\ &= \frac{10^6}{60 \times 1\,000} \times \left(\frac{183 \times 10^3}{19\,867} \right)^{10/3} \\ &\doteq 27\,300 \text{ h} \end{aligned}$$

[Bearing B]

$$\begin{aligned} L_{10hB} &= \frac{10^6}{60n} \left(\frac{C_{rB}}{P_B} \right)^p \\ &= \frac{10^6}{60 \times 1\,000} \times \left(\frac{221 \times 10^3}{23\,971} \right)^{10/3} \\ &\doteq 27\,400 \text{ h} \end{aligned}$$

Reference

Using equation (5-11), the system service life (L_{10hS}) using a pair of bearings is :

$$\begin{aligned} L_{10hS} &= \frac{1}{\left(\frac{1}{L_{10hA}^e} + \frac{1}{L_{10hB}^e} \right)^{1/e}} \\ &= \frac{1}{\left(\frac{1}{27\,300^{8/9}} + \frac{1}{27\,400^{8/9}} \right)^{8/9}} \\ &\doteq 14\,800 \text{ h} \end{aligned}$$

6. Boundary dimensions and bearing numbers

6-1 Boundary dimensions

Bearing boundary dimensions are dimensions required for bearing installation with shaft or housing, and as described in Fig. 6-1, include the bore diameter, outside diameter, width, height, and chamfer dimension.

These dimensions are standardized by the International Organization for Standardization (ISO 15). JIS B 1512 "rolling bearing boundary dimensions" is based on ISO.

These boundary dimensions are provided, classified into radial bearings (tapered roller bearings are provided in other tables) and thrust bearings.

Boundary dimensions of each bearing are listed in Appendixes at the back of this catalog. In these boundary dimension tables, the outside diameter, width, height, and chamfer dimen-

sions related to bearing bore diameter numbers and bore diameters are listed in diameter series and dimension series.

Reference

- 1) Diameter series is a series of nominal bearing outside diameters provided for respective ranges of bearing bore diameter; and, a dimension series includes width and height as well as diameters.
- 2) Tapered roller bearing boundary dimensions listed in the Appendixes are adapted to conventional dimension series (widths and diameters). Tapered roller bearing boundary dimensions provided in JIS B 1512-2000 are new dimension series based on ISO 355 (ref. descriptions before the bearing specification table); for reference, the bearing specification table covers numeric codes used in these dimension series.

Fig. 6-1 Bearing boundary dimensions

Cross-section dimensions of radial bearings and thrust bearings expressed in dimension series can be compared using Figs. 6-2 and 6-3.

In this way, many dimension series are provided; however, not all dimensions are practically adapted.

Some of them were merely prescribed, given expected future use.

6-2 Dimensions of snap ring grooves and locating snap rings

JIS B 1509 "rolling bearing -radial bearing with locating snap ring-dimensions and tolerances" conforms to the dimensions of snap ring groove for fitting locating snap ring on the outside surface of bearing and the dimensions and tolerances of locating snap ring.

Fig. 6-3 Thrust bearing dimension series diagram (diameter series 5 omitted)

Fig. 6-2 Radial bearing dimension series diagram (diameter series 7 omitted)

6-3 Bearing number

A bearing number is composed of a basic number and a supplementary code, denoting bearing specifications including bearing type, boundary dimensions, running accuracy, and internal clearance.

Bearing numbers of standard bearings corresponding to JIS B 1512 "rolling bearing boundary dimensions" are prescribed in JIS B 1513.

As well as these bearing numbers, JTEKT uses supplementary codes other than those provided by JIS.

Among basic numbers, bearing series codes are listed in Table 6-1, and the composition of bearing numbers is described in Table 6-2, showing the order of arrangement of the parts.

Contact angle code

A	(omitted) 30°	Angular contact ball bearing
AC	25°	
B	40°	
C	15°	
CA	20°	
E	35°	Tapered roller bearing
B	(omitted) Less than 17°	
C	20°	
D	28° 30'	
DJ	28° 48' 39"	

Internal design code

R	Reinforced capacity (Deep groove ball bearing, cylindrical roller bearing, tapered roller bearing)

G	Equal stand-out is provided on both sides of the ring of angular contact ball bearing (In general, C2 clearance is used)
GST	Angular contact ball bearing described above with standard internal clearance provided
J	Tapered roller bearing, whose outer ring width, contact angle and outer ring small inside diameter conform to ISO standards
R (RR)	With convex asymmetric rollers and machined cage
RZ	With convex symmetric rollers and pressed cage
RHA	With convex symmetric rollers and one-piece machined cage
Spherical roller bearings	
V	Full complement type ball or roller bearing (with no cage)

Shield/seal code

one side	both sides	
Z	ZZ	Fixed shield
ZX	ZZX	Removable shield
ZU	2ZU	Non-contact seal
RU	2RU	
RS	2RS	Contact seal
RK	2RK	
U	UU	Extremely light contact seal
RD	2RD	

Ring shape code, lubrication hole/groove code

K	Inner ring tapered bore provided (1 : 12)
K30	Inner ring tapered bore provided (1 : 30)
N	Snap ring groove on outer ring outside surface provided
NR	Snap ring groove and locating snap ring on outer ring outside surface provided

(Codes and descriptions)

NY	Creep prevention synthetic resin ring on outer ring outside surface provided
SG	Spiral groove on inner ring bore surface provided
W	Lubrication hole and lubrication groove on cylindrical roller bearing outer ring outside surface provided
W33	Lubrication hole and lubrication groove on spherical roller bearing outer ring outside surface provided

Material code, special treatment code

Code not given	High carbon chrome bearing steel
E	Case carburizing steel
F	
H	
Y	
ST	Stainless steel
SH	Special heat treatment
S0	Up to 150 °C
S1	Up to 200 °C (Dimension stabilizing treatment)
S2	Up to 250 °C

Matched pair or stack code, cage guide code

DB	Back-to-back arrangement	Angular contact ball bearing
DF	Face-to-face arrangement	
DT	Tandem arrangement	
PA	With outer ring guide cage (Ball bearing)	
Q3	With roller guide cage (Roller bearing)	

Internal clearance code, preload code

C1	Smaller than C2	Radial internal clearance for radial bearing
C2	Smaller than standard clearance	
CN	Standard clearance	
C3	Greater than standard clearance	
C4	Greater than C3	
C5	Greater than C4	Radial internal clearance for extra-small/miniature ball bearing
M1 to M6		
CD2	Smaller than standard clearance	
CDN	Standard clearance	Radial internal clearance for double-row angular contact ball bearing
CD3	Greater than standard clearance	

CM	Radial internal clearance for electric motor bearing	(Deep groove ball bearing)
CT		(Cylindrical roller bearing)

NA	Non-interchangeable cylindrical roller bearing radial internal clearance (C1NA to C5NA)	
S	Slight preload	(Preload for angular contact ball bearing)
L	Light preload	
M	Medium preload	
H	Heavy preload	

Spacer code	Spacer width (mm) is affixed to the end of each code.	
+	Inner and outer ring spacers provided	(Deep groove ball bearing)
/	Inner and outer ring spacers provided	(Angular contact ball bearing)
/P	Outer ring spacer provided	(Angular contact ball bearing)
/S	Inner ring spacer provided	
+DP	Inner and outer ring spacers provided	(Cylindrical roller bearing, spherical roller bearing)
+IDP	Inner ring spacer provided	
+ODP	Outer ring spacer provided	

Cage material/type code

//	Steel sheet	(Pressed cage)
YS	Stainless steel sheet	
FT	Phenol resin	
FY	High-tensile brass casting	(Machined cage)
FW	High-tensile brass casting (separable type)	
MG	Polyamide	(Molded cage)
FG		
FP	Carbon steel	(Pin type cage)

Tolerance code (JIS)

Omitted	Class 0
P6	Class 6
P6X	Class 6X
P5	Class 5
P4	Class 4
P2	Class 2

Grease code

A2	Alvania 2
B5	Beacon 325
SR	SR grease

7. Bearing tolerances

7-1 Tolerances and tolerance classes for bearings

Bearing tolerances and permissible values for the boundary dimensions and running accuracy of bearings are specified.

These tolerances are prescribed in JIS B 1514-1, JIS B 1514-2, and JIS B 1514-3 (roller bearings - bearing tolerances part 1: radial bearings, part 2: thrust bearings, and part 3: permissible values for chamfer dimensions). (These JIS standards are based on ISO standards.)

Bearing tolerances are standardized by classifying bearings into the following six classes (accuracy in tolerances becomes higher in the order described): 0, 6X, 6, 5, 4 and 2.

Class 0 bearings offer adequate performance for general applications; and, bearings of class 5 or higher are required for demanding applications and operating conditions including those described in Table 7-1.

These tolerances follow ISO standards, but some countries use different names for them. Tolerances for each bearing class, and organizations concerning bearings are listed in Table 7-2.

- Boundary dimension accuracy
(items on shaft and housing mounting dimensions)
 - Tolerances for bore diameter, outside diameter, ring width, assembled bearing width
 - Tolerances for set bore diameter and set outside diameter of rollers
 - Tolerance limits for chamfer dimensions
 - Permissible values for width variation
 - Tolerance and permissible values for tapered bore
- Running accuracy
(items on runout of rotating elements)
 - Permissible values for radial and axial runout of inner and outer rings
 - Permissible values for perpendicularity of inner ring face
 - Permissible values for perpendicularity of outer ring outside surface
 - Permissible values for thrust bearing raceway thickness

Accuracies for dimensions and running of each bearing type are listed in Tables 7-3 through 7-10; and, tolerances for tapered bore and limit values for chamfer dimensions of radial bearings are in Tables 7-11 and 7-12.

Table 7-1 High precision bearing applications

Required performance	Applications	Tolerance class
High accuracy in runout is required for rolling elements.	Radar / parabola antenna slewing shafts	Class 4
	Machine tool spindles	Class 5,4,2, ABEC 9
	Aluminum foil roll necks	Class 5
	Multi-stage mill backing bearings	Class 4
High speed rotation	Dental spindles	Class 2, ABMA 5P,7P
	Superchargers	Class 5,4
	Jet engine spindles and accessories	Class 5,4
	Centrifugal separators	Class 5,4
	LNG pumps	Class 5
	Turbo molecular pump spindles and touch-down	Class 5,4
	Machine tool spindles	Class 5,4,2, ABEC 9
	Tension reels	Class 5,4
Low friction or low friction variation is required.	Control equipment (synchronous motors, servomotors, gyro gimbals)	Class 4, ABMA 7P
	Measuring instruments	Class 5
	Machine tool spindles	Class 5,4,2, ABEC 9

 ABMA : American Bearing Manufacturers Association
 DIN : Deutsches Institut für Normung
 BS : British Standards Institution
 NF : Association Francaise de Normalisation

= JIS B 1514-1 =

Unit : μm

The diagram shows a cross-section of a tapered roller bearing. The outer diameter is labeled ϕD and the inner diameter is labeled ϕd . The width of the bearing is labeled B . The taper of the rollers is indicated as $\frac{1}{12}$ or $\frac{1}{30}$.

Tapered bore

Unit : μm

S_d : perpendicularity of inner ring face with respect to the bore S_{ia} : axial runout of assembled bearing inner ring

3) These shall be applied to individual bearing rings manufactured for matched pair or stack bearings.

[Remark] Values in Italics are prescribed in JTEKT standards.

Table 7-3 (2) Radial bearing tolerances (tapered roller bearings excluded)

1 000	1 250	+ 165	0	+ 105	0	—
1 250	1 600	+ 195	0	+ 125	0	—

[Note] 1) These shall be applied to all radial planes with tapered bore, not be applied to bearings of diameter series 7, 8.

[Remark] 1) Symbols of quantity d_1 : reference diameter at theoretical large end of tapered bore

$$d_1 = d + \frac{1}{12} B \text{ or } d_1 = d + \frac{1}{30} B$$

Δ_{dmp} : single plane mean bore diameter deviation at theoretical small end of tapered bore

Δ_{d1mp} : single plane mean bore diameter deviation at theoretical large end of tapered bore

V_{dsp} : single plane bore diameter variation (a tolerance for the diameter variation given by a maximum value applying in any radial plane of the bore)

B : nominal inner ring width

α : $\frac{1}{2}$ of nominal tapered angle of tapered bore

(tapered ratio 1/12)

$\alpha = 2^\circ 23' 9.4''$

$= 2.385 94^\circ$

$= 0.041 643 \text{ rad}$

(2) Basically tapered bore (taper 1:30) Unit : μm

7-2 Tolerance measuring method (reference)

The details on measuring methods for bearings are prescribed in JIS B 1515-2.

This section outlines measuring methods for dimensional and running accuracy.

Dimensional accuracy (1)

Bore diameter (<i>d</i>) Cylindrical bore bearings	Obtain the maximum value ($d_{sp \max}$) and the minimum value ($d_{sp \min}$) of the bore diameter (d_s) acquired in a single radial plane. Obtain the single plane mean bore diameter (d_{mp}) as the arithmetic mean value of the maximum value ($d_{sp \max}$) and minimum values ($d_{sp \min}$).  $d_{mp} = \frac{d_{sp \max} + d_{sp \min}}{2}$ Single plane mean bore diameter deviation ; $\Delta d_{mp} = d_{mp} - d$ Bore diameter variation in a single plane ; $V_{dsp} = d_{sp \max} - d_{sp \min}$ Mean bore diameter variation ; $V_{dmp} = d_{mp \max} - d_{mp \min}$ Deviation of a single bore diameter ; $\Delta d_s = d_s - d$
Bore diameter (<i>d</i>) Tapered bore bearings	Bore diameter at the theoretical small end and bore diameter at the theoretical large end ;  $d_s = \frac{d_{bs} \cdot h_a - d_{as} \cdot h_b}{h_a - h_b}$ $d_{1s} = \frac{d_{as}(B - h_b) - d_{bs}(B - h_a)}{h_a - h_b}$ Single plane mean bore diameter deviation at the theoretical small end ; $\Delta d_{mp} = d_{mp} - d$ Deviation on taper ; $(\Delta d_{1mp} - \Delta d_{mp}) = (d_{1mp} - d_1) - (d_{mp} - d)$ Bore diameter variation in a single plane ; $V_{dsp} = d_{sp \max} - d_{sp \min}$
Outside diameter (<i>D</i>)	Obtain the single plane mean outside diameter (D_{mp}) as the arithmetical mean value of the maximum value ($D_{sp \max}$) and the minimum value ($D_{sp \min}$) of the outside diameters (D_s) acquired in a single radial plane.  $D_{mp} = \frac{D_{sp \max} + D_{sp \min}}{2}$ Single plane mean outside diameter deviation ; $\Delta D_{mp} = D_{mp} - D$ Outside diameter variation in a single plane ; $V_{Dsp} = D_{sp \max} - D_{sp \min}$ Mean outside diameter variation ; $V_{Dmp} = D_{mp \max} - D_{mp \min}$ Deviation of a single outside diameter ; $\Delta D_s = D_s - D$

Dimensional accuracy (2)

Roller set bore diameter (F_w)	 Deviation of the roller set bore diameter ; $\Delta F_w = (d_G + \delta_{1m}) - F_w$ Deviation of the minimum diameter of the roller set bore diameter ; $\Delta F_{w \min} = (d_G + \delta_{1min}) - F_w$ (d_G) outside diameter of the master gauge (δ_{1m}) arithmetical mean value of the amount of movement of the outer ring (δ_{1min}) minimum value of the amount of movement of the outer ring
Roller set outside diameter (E_w)	 Deviation of the roller set outside diameter ; $\Delta E_w = (D_G + \delta_{2m}) - E_w$ (D_G) bore diameter of the master gauge (δ_{2m}) arithmetical mean value of the amount of movement of the master gauge
Inner ring width (<i>B</i>) Outer ring width (<i>C</i>)	 Deviation of a single inner ring width ; $\Delta B_s = B_s - B$ Inner ring width variation ; $V_{Bs} = B_{s \max} - B_{s \min}$  Deviation of a single outer ring width ; $\Delta C_s = C_s - C$ Outer ring width variation ; $V_{Cs} = C_{s \max} - C_{s \min}$
Assembled bearing width of tapered roller bearing (<i>T</i>)	 Deviation of the actual bearing width ; $\Delta T_s = T_s - T$
Nominal effective width of tapered roller bearing (T_1, T_2)	 Deviation of the actual effective width of inner sub-unit ; $\Delta T_{1s} = T_{1s} - T_1$  Deviation of the actual effective width of outer ring ; $\Delta T_{2s} = T_{2s} - T_2$
Nominal height of thrust ball bearing with flat back face (<i>T, T₁</i>)	 Deviation of the actual bearing height ; $\Delta T_s = T_s - T$ (single direction) $\Delta T_{1s} = T_{1s} - T_1$ (double direction)

Running accuracy (1)

Radial runout of assembled bearing inner ring (K_{ia})	 The radial runout of the inner ring (K_{ia}) shall be obtained as the difference between the maximum value and the minimum value of the readings of the measuring instrument, when the inner ring has been rotated through one rotation. [Note] The measurement of the radial runout of the inner ring of cylindrical roller bearings, machined ring needle roller bearings, self-aligning ball bearings and spherical roller bearings shall be carried out by fixing the outer ring with ring supports.
Radial runout of assembled bearing outer ring (K_{ea})	 The measurement of outer ring runout (K_{ea}) shall be obtained as the difference between the maximum value and the minimum value of the readings of the measuring instrument, when the outer ring has been rotated through one rotation. [Note] The measurement of the radial runout of the outer ring of cylindrical roller bearings, machined ring needle roller bearings, self-aligning ball bearings and spherical roller bearings shall be carried out by fixing the inner ring with ring supports.
Axial runout of assembled bearing inner ring (S_{ia})	 The axial runout of the inner ring (S_{ia}) shall be obtained as the difference between the maximum value and the minimum value of the readings of the measuring instrument, when the inner ring has been rotated through one rotation.
Axial runout of assembled bearing outer ring (S_{ea})	 The axial runout of the outer ring (S_{ea}) shall be obtained as the difference between the maximum value and the minimum value of the readings of the measuring instrument, when the outer ring has been rotated through one rotation.

Running accuracy (2)

Perpendicularity of inner ring face with respect to the bore (S_d)	 Perpendicularity of inner ring face (S_d) shall be obtained as the difference between the maximum value and the minimum value of the readings of the measuring instrument, when the inner ring has been rotated through one rotation with the tapered arbor.
Perpendicularity of outer ring outside surface with respect to the face (S_D)	 Perpendicularity of outer ring outside surface (S_D) shall be obtained as the difference between the maximum value and the minimum value of the readings of the measuring instrument, when the outer ring has been rotated through one rotation along the guide stopper.
Shaft/central race raceway to back face thickness variation of thrust ball bearing with flat back face (S_i)	 The measurement of the thickness variation (S_i) of shaft race raceway track shall be obtained as the difference between the maximum value and the minimum value of the readings of the measuring instrument, when the shaft race has been rotated through one rotation along the guide stopper. For the central race, carry out the same measurement for the two raceway grooves to obtain the thickness variation of the raceway track (S_i).
Housing race raceway to back face thickness variation of thrust ball bearing with flat back face (S_e)	 The measurement of the thickness variation (S_e) of housing race raceway track shall be obtained as the difference between the maximum value and the minimum value of the readings of the measuring instrument, when the housing race has been rotated through one rotation along the guide stopper.

8. Limiting speed

The rotational speed of a bearing is normally affected by friction heat generated in the bearing. If the heat exceeds a certain amount, seizure or other failures occur, thus causing rotation to be discontinued.

The limiting speed is the highest speed at which a bearing can continuously operate without generating such critical heat.

The limiting speed differs depending on various factors including bearing type, dimensions and their accuracy, lubrication, lubricant type and amount, shapes of cages and materials and load conditions, etc.

The limiting speed determined under grease lubrication and oil lubrication (oil bath) for each bearing type are listed in the bearing specification table.

These speeds are applied when bearings of standard design are rotated under normal load conditions (approximately, $C/P \geq 16^*$, $F_a/F_r \leq 0.25$).

Each lubricant has superior performance in use, according to type.

Some are not suitable for high speed; when bearing rotational speed exceeds 80 % of catalog specification, consult with JTEKT.

Fig. 8-1a Values of correction coefficient f_1 of load magnitude (Excludes K type bearings and railway rolling stock axle journals)

Fig. 8-1b Values of correction coefficient f_1 of load magnitude (K type bearings and railway rolling stock axle journals)

8-1 Correction of limiting speed

When the load condition is $C/P < 16^*$, i.e. the dynamic equivalent load P exceeds approximately 6 % of basic dynamic load rating C , or when a combined load in which the axial load is greater than 25 % of radial load is applied, the limiting speed should be corrected by using equation (8-1) :

$$n_a = f_1 \cdot f_2 \cdot n \quad (8-1)$$

where :

n_a : corrected limiting speed	min^{-1}
f_1 : correction coefficient determined from the load magnitude (Fig. 8-1)	
f_2 : correction coefficient determined from combined load (Fig. 8-2)	
n : limiting speed under normal load condition	min^{-1}
C : basic dynamic load rating	N
P : dynamic equivalent load	N
F_r : radial load	N
F_a : axial load	N

* 13 (8 %) for K type bearings and railway rolling stock axle journals

Fig. 8-2 Values of correction coefficient f_2 of combined load

8-2 Limiting speed for sealed ball bearings

The limiting speed of ball bearings with a contact seal (RS, RK type) are determined by the rubbing speed at which the seal contacts the inner ring. These allowable rubbing speeds differ depending on seal rubber materials; and, for ball bearings with the JTEKT standard contact type seal (NBR), a rubbing speed of 15 m/s is utilized.

8-3 Considerations for high speed

When bearings are used for high speed, especially when the rotation speed approaches the limiting speed or exceeds it, the following should be considered :
(for further information on high speed, consult with JTEKT)

- (1) Use of high precision bearings
- (2) Study of proper internal clearance
(Reduction in internal clearance caused by temperature increase should be considered.)
- (3) Selection of proper cage type and materials
(For high speed, copper alloy or phenolic resin machined cages are suitable. Synthetic resin molded cages for high speed are also available.)
- (4) Selection of proper lubrication
(Suitable lubrication for high speed should be selected jet lubrication, oil mist lubrication and oil air lubrication, etc.)

8-4 Frictional coefficient (reference)

The frictional moment of rolling bearings can be easily compared with that of plain bearings. The frictional moment of rolling bearings can be obtained from their bore diameter, using the following equation :

$$M = \mu P \frac{d}{2} \quad (8-2)$$

where :

M : frictional moment	$\text{mN} \cdot \text{m}$
μ : frictional coefficient	
P : load on the bearing	N
d : nominal bore diameter	mm

The friction coefficient is greatly dependent on bearing type, bearing load, rotation speed and lubrication, etc.

Reference values for the friction coefficient during stable operation under normal operating conditions are listed in Table 8-1.

For plain bearings, the value is normally 0.01 to 0.02 ; but, for certain cases, it is 0.1 to 0.2.

Table 8-1 Friction coefficient μ

Bearing type	Friction coefficient μ
Deep groove ball bearing	0.001 0 – 0.001 5
Angular contact ball bearing	0.001 2 – 0.002 0
Self-aligning ball bearing	0.000 8 – 0.001 2
Cylindrical roller bearing	0.000 8 – 0.001 2
Full complement type needle roller bearing	0.002 5 – 0.003 5
Needle roller and cage assembly	0.002 0 – 0.003 0
Tapered roller bearing	0.001 7 – 0.002 5
Spherical roller bearing	0.002 0 – 0.002 5
Thrust ball bearing	0.001 0 – 0.001 5
Spherical thrust roller bearing	0.002 0 – 0.002 5

9. Bearing fits

9-1 Purpose of fit

The purpose of fit is to securely fix the inner or outer ring to the shaft or housing, to preclude detrimental circumferential sliding on the fitting surface.

Such detrimental sliding (referred to as "creep") will cause abnormal heat generation, wear of the fitting surface, infiltration of abrasion metal particles into the bearing, vibration, and many other harmful effects, which cause a deterioration of bearing functions.

Therefore, it is necessary to fix the bearing ring which is rotating under load to the shaft or housing with interference.

9-2 Tolerance and fit for shaft & housing

For metric series bearings, tolerances for the shaft diameter and housing bore diameter are standardized in JIS B 0401-1 and 0401-2 "ISO system of limits and fits - Part 1 and Part 2" (based on ISO 286; shown in Appendixes at the back of this catalogue). Bearing fits on the shaft and housing are determined based on the tolerances specified in the above standard.

Fig. 9-1 shows the relationship between tolerances for shaft and housing bore diameters and fits for bearings of class 0 tolerance.

Fig. 9-1 Relationship between tolerances for shaft/housing bore diameters and fits
(bearings of class 0 tolerance)

9-3 Fit selection

In selecting the proper fit, careful consideration should be given to bearing operating conditions.

Major specific considerations are :

- Load characteristics and magnitude
- Temperature distribution in operating
- Bearing internal clearance
- Surface finish, material and thickness of shaft and housing
- Mounting and dismounting methods
- Necessity to compensate for shaft thermal expansion at the fitting surface
- Bearing type and size

In view of these considerations, the following paragraphs explain the details of the important factors in fit selection.

1) Load characteristics

Load characteristics are classified into three types : rotating inner ring load; rotating outer ring load and indeterminate direction load.

Table 9-1 tabulates the relationship between these characteristics and fit.

Table 9-1 Load characteristics and fits

Rotation pattern	Direction of load	Loading conditions	Fit		Typical application
			Inner ring & shaft	Outer ring & housing	
 Inner ring : rotating Outer ring : stationary	 Stationary	Rotating inner ring load	Interference fit necessary	Clearance fit acceptable	Spur gear boxes, motors
 Inner ring : stationary Outer ring : rotating	 Rotating (with outer ring)	Stationary outer ring load	(k, m, n, p, r)	(F, G, H, JS)	Greatly unbalanced wheels
 Inner ring : stationary Outer ring : rotating	 Stationary	Stationary inner ring load	Clearance fit acceptable	Interference fit necessary	Running wheels & pulleys with stationary shaft
 Inner ring : rotating Outer ring : stationary	 Rotating (with inner ring)	Rotating outer ring load	(f, g, h, js)	(K, M, N, P)	Shaker screens (unbalanced vibration)
Indeterminate	Rotating or stationary	Indeterminate direction load	Interference fit	Interference fit	Cranks

2) Effect of load magnitude

When a radial load is applied, the inner ring will expand slightly. Since this expansion enlarges the circumference of the bore minutely, the initial interference is reduced.

The reduction can be calculated by the following equations :

[In the case of $F_r \leq 0.25 C_0$]

$$\Delta_{dF} = 0.08 \sqrt{\frac{d}{B}} \cdot F_r \times 10^{-3} \dots\dots\dots (9-1)$$

[In the case of $F_r > 0.25 C_0$]

$$\Delta_{dF} = 0.02 \frac{F_r}{B} \times 10^{-3} \dots\dots\dots (9-2)$$

where:

Δ_{dF} : reduction of inner ring interference mm
 d : nominal bore diameter of bearing mm
 B : nominal inner ring width mm
 F_r : radial load N
 C_0 : basic static load rating N

Consequently, when the radial load, exceeds the C_0 value by more than 25 %, greater interference is needed.

Much greater interference is needed, when impact loads are expected.

3) Effect of fitting surface roughness

The effective interference obtained after fitting differs from calculated interference due to plastic deformation of the ring fitting surface. When the inner ring is fitted, the effective interference, subject to the effect of the fitting surface finish, can be approximated by the following equations :

[In the case of a ground shaft]

$$\Delta_{deff} \doteq \frac{d}{d+2} \Delta_d \dots\dots\dots (9-3)$$

[In the case of a turned shaft]

$$\Delta_{deff} \doteq \frac{d}{d+3} \Delta_d \dots\dots\dots (9-4)$$

where:

Δ_{deff} : effective interference mm
 Δ_d : calculated interference mm
 d : nominal bore diameter of bearing mm

4) Effect of temperature

A bearing generally has an operating temperature, higher than the ambient temperature. When the inner ring operates under load, its temperature generally becomes higher than that of the shaft and the effective interference decreases due to the greater thermal expansion of the inner ring.

If the assumed temperature difference between the bearing inside and surrounding housing is Δ_t , the temperature difference at the fitting surfaces of the inner ring and shaft will be approximately $(0.10 \text{ to } 0.15) \times \Delta_t$.

The reduction of interference (Δ_{dt}) due to temperature difference is then expressed as follows :

$$\begin{aligned} \Delta_{dt} &= (0.10 \text{ to } 0.15) \Delta_t \cdot \alpha \cdot d \\ &\doteq 0.0015 \Delta_t \cdot d \times 10^{-3} \dots\dots\dots (9-5) \end{aligned}$$

where:

Δ_{dt} : reduction of interference due to temperature difference mm
 Δ_t : temperature difference between the inside of the bearing and the surrounding housing °C
 α : linear expansion coefficient of bearing steel ($\doteq 12.5 \times 10^{-6}$) 1/°C
 d : nominal bore diameter of bearing mm

Consequently, when a bearing is higher in temperature than the shaft, greater interference is required.

However, a difference in temperature or in the coefficient of expansion may sometimes increase the interference between outer ring and housing. Therefore, when clearance is provided to accommodate shaft thermal expansion, care should be taken.

5) Maximum stress due to fit

When a bearing is fitted with interference, the bearing ring will expand or contract, generating internal stress.

Should this stress be excessive, the bearing ring may fracture.

The maximum bearing fitting-generated stress is determined by the equation in Table 9-2.

In general, to avoid fracture, it is best to adjust the maximum interference to less than 1/1 000 of the shaft diameter, or the maximum stress (σ), determined by the equation in Table 9-2, should be less than 120 MPa.

6) Other considerations

When a high degree of accuracy is required, the tolerance of the shaft and housing must be improved. Since the housing is generally less easy to machine precisely than the shaft, it is advisable to use a clearance fit on the outer ring.

With hollow shafts or thin section housings, greater than normal interference is needed.

With split housings, on the other hand, smaller interference with outer ring is needed.

When the housing is made of aluminum or other light metal alloy, relatively greater than normal interference is needed.

In such a case, consult with JTEKT.

Table 9-2 Maximum fitting-generated stress in bearings

Shaft & inner ring	Housing bore & outer ring
(In the case of hollow shaft)	(In the case of $D_h \neq \infty$)
$\sigma = \frac{E}{2} \cdot \frac{\Delta_{deff}}{d} \cdot \frac{\left(1 - \frac{d_0^2}{d^2}\right) \left(1 + \frac{d^2}{D_i^2}\right)}{\left(1 - \frac{d_0^2}{D_i^2}\right)}$	$\sigma = E \cdot \frac{\Delta_{Deff}}{D} \cdot \frac{\left(1 - \frac{D^2}{D_h^2}\right)}{\left(1 - \frac{D_e^2}{D_h^2}\right)}$
(In the case of solid shaft)	(In the case of $D_h = \infty$)
$\sigma = \frac{E}{2} \cdot \frac{\Delta_{deff}}{d} \cdot \left(1 + \frac{d^2}{D_i^2}\right)$	$\sigma = E \cdot \frac{\Delta_{Deff}}{D}$

where :

σ : maximum stress MPa
 d : nominal bore diameter (shaft diameter) mm
 D_i : raceway contact diameter of inner ring mm
 $\left\{ \begin{array}{l} \text{ball bearing} \dots\dots D_i \doteq 0.2 (D + 4 d) \\ \text{roller bearing} \dots D_i \doteq 0.25 (D + 3 d) \end{array} \right.$
 Δ_{deff} : effective interference of inner ring mm
 d_0 : bore diameter of hollow shaft mm
 D_e : raceway contact diameter of outer ring mm
 $\left\{ \begin{array}{l} \text{ball bearing} \dots\dots D_e \doteq 0.2 (4D + d) \\ \text{roller bearing} \dots D_e \doteq 0.25 (3D + d) \end{array} \right.$
 D : nominal outside diameter (bore diameter of housing) mm
 Δ_{Deff} : effective interference of outer ring mm
 D_h : outside diameter of housing mm
 E : young's modulus 2.08×10^5 MPa

[Remark] The above equations are applicable when the shaft and housing are steel. When other materials are used, JTEKT should be consulted.

9-4 Recommended fits

As described in Section 9-3, the characteristics / magnitude of the bearing load, temperature, mounting / dismounting methods and other conditions must be considered to choose proper fits.

Past experience is also valuable. Table 9-3 shows standard fits for the metric series bearings; Tables 9-4 to 9-8 tabulate the most typical and recommended fits for different bearings types.

Table 9-3 Standard fits for metric series bearings¹⁾

(1) Fits for bore diameter ²⁾ of radial bearings										
Class of bearing	Rotating inner ring load or indeterminate direction load						Stationary inner ring load			
	Class of shaft tolerance range									
Classes 0, 6X, 6	r 6	p 6	n 6	m 6 m 5	k 6 k 5	js 6 js 5	h 5	h 6 h 5	g 6 g 5	f 6
Class 5	–	–	–	m 5	k 4	js 4	h 4	h 5	–	–
Fit	Interference fit					Transition fit			Clearance fit	

(2) Fits for outside diameter²⁾ of radial bearings

Class of bearing	Stationary outer ring load				Indeterminate direction load or rotating outer ring load				
	Class of housing bore tolerance range								
Classes 0, 6X, 6	G 7	H 7 H 6	JS 7 JS 6	–	JS 7 JS 6	K 7 K 6	M 7 M 6	N 7 N 6	P 7
Class 5	–	H 5	JS 5	K 5	–	K 5	M 5	–	–
Fit	Clearance fit		Transition fit						Interference fit

(3) Fits for bore diameter²⁾ of thrust bearings

Class of bearing	Central axial load (generally for thrust bearings)		Combined load (in the case of spherical thrust roller bearing)			
			Rotating shaft race load or indeterminate direction load		Stationary shaft race load	
	Class of shaft tolerance range					
Classes 0, 6	js 6	h 6	n 6	m 6	k 6	js 6
Fit	Transition fit		Interference fit			Transition fit

(4) Fits for outside diameter²⁾ of thrust bearings

Class of bearing	Central axial load (generally for thrust bearings)		Combined load (in the case of spherical thrust roller bearing)				
			Stationary housing race load or indeterminate direction load		Rotating housing race load		
	Class of housing bore tolerance range						
Classes 0, 6	–	H 8	G 7	H 7	JS 7	K 7	M 7
Fit	Clearance fit				Transition fit		

[Notes] 1) Bearings specified in JIS B 1512
2) Follow JIS B 1514-1 and 1514-2 for tolerance.

Table 9-4 (1) Recommended shaft fits for radial bearings (classes 0, 6X, 6)

Conditions ¹⁾		Ball bearing		Cylindrical roller bearing Tapered roller bearing		Spherical roller bearing		Class of shaft tolerance range	Remarks	Applications (for reference)
		Shaft diameter (mm)								
		over	up to	over	up to	over	up to			
Cylindrical bore bearing (classes 0, 6X, 6)										
Rotating inner ring load or indeterminate direction load	Light load or fluctuating load $\left(\frac{P_r}{C_r} \leq 0.05\right)$	–	18	–	–	–	–	h 5	For applications requiring high accuracy, js 5,k 5 and m 5 should be used in place of js 6, k 6 and m 6.	Electric appliances, machine tools, pumps, blowers, carriers etc.
		18	100	–	40	–	–	js 6		
		100	200	40	140	–	–	k 6		
		–	–	140	200	–	–	m 6		
	Normal load $\left(0.05 < \frac{P_r}{C_r} \leq 0.10\right)$	–	18	–	–	–	–	js 5	For single-row tapered roller bearings and angular contact ball bearings, k 5 and m 5 may be replaced by k 6 and m 6, because internal clearance reduction due to fit need not be considered.	Electric motors, turbines, internal combustion engines, wood-working machines etc.
		18	100	–	40	–	40	k 5		
		100	140	40	100	40	65	m 5		
		140	200	100	140	65	100	m 6

		–	–	200	400	140	280	p 6		
	–	–	–	–	280	500	r 6			
	Heavy load or impact load $\left(\frac{P_r}{C_r} > 0.10\right)$	–	–	50	140	50	100	n 6	Bearings with larger internal clearance than standard are required.	Railway rolling stock axle journals, traction motors
–		–	140	200	100	140	p 6			
–		–	200	–	140	200	r 6			
Stationary inner ring load	Inner ring needs to move smoothly on shaft.	All shaft diameters						g 6	For applications requiring high accuracy, g 5 should be used. For large size bearing, f 6 may be used for easier movement.	Stationary shaft wheels
	Inner ring does not need to move smoothly on shaft.	All shaft diameters						h 6	For applications requiring high accuracy, h 5 should be used.	Tension pulleys, rope sheaves etc.
Central axial load only		All shaft diameters						js 6	–	
Tapered bore bearing (class 0) (with adapter or withdrawal sleeve)										
All loads		All shaft diameters						h 9/IT 5 ²⁾	For transmission shafts, h 10/IT 7 ²⁾ may be applied.	–

[Notes] 1) Light, normal, and heavy loads refer to those with dynamic equivalent radial loads (P_r) of 5 % or lower, over 5 % up to 10 % inclusive, and over 10 % respectively in relation to the basic dynamic radial load rating (C_r) of the bearing concerned.
2) IT 5 and IT 7 mean that shaft roundness tolerance, cylindricity tolerance, and other errors in terms of shape should be within the tolerance range of IT 5 and IT 7, respectively. For numerical values for standard tolerance grades IT 5 and IT 7, refer to supplementary table at end of this catalog.

[Remark] This table is applicable to solid steel shafts.

Table 9-4 (2) Recommended housing fits for radial bearings (classes 0, 6X, 6)

Conditions			Class of housing bore tolerance range	Remarks	Applications (for reference)
Housing	Load type etc. ¹⁾	Outer ring axial displacement ²⁾			
One-piece or split type	All load types	Easily displaceable	H 7	G 7 may be applied when a large size bearing is used, or if the temperature difference is large between the outer ring and housing.	Ordinary bearing devices, railway rolling stock axle boxes, power transmission equipment etc.
	Light or normal load		H 8	–	
	Stationary outer ring load		G 7	F 7 may be applied when a large size bearing is used, or if the temperature difference is large between the outer ring and housing.	Drying cylinders etc.
	High temperature at shaft and inner ring				
One-piece type	Light or normal load, requiring high running accuracy	Not displaceable in principle	K 6	Mainly applied to roller bearings.	
		Displaceable	JS 6	Mainly applied to ball bearings.	
		Requiring low-noise rotation	H 6	–	
	Indeterminate direction load	Light or normal load	JS 7	For applications requiring high accuracy, JS 6 and K 6 should be used in place of JS 7 and K 7.	Electric motors, pumps, crankshaft main bearings etc.
		Normal or heavy load	K 7		
		High impact load	M 7	–	Traction motors etc.
	Rotating outer ring load	Light or fluctuating load	M 7	–	Conveyor rollers, ropeways, tension pulleys etc.
		Normal or heavy load	N 7	Mainly applied to ball bearings.	Wheel hubs with ball bearings etc.
		Thin section housing, heavy or high impact load	P 7	Mainly applied to roller bearings.	Wheel hubs with roller bearings, bearings for large end of connecting rods etc.

[Notes] 1) Loads are classified as stated in Note 1) to Table 9-4 (1).

2) Indicating distinction between applications of non-separable bearings permitting and not permitting axial displacement of the outer rings.

[Remarks] 1. This table is applicable to cast iron or steel housings.

2. If only central axial load is applied to the bearing, select such tolerance range class as to provide clearance in the radial direction for outer ring.

Table 9-5 (1) Recommended shaft fits for precision extra-small/miniature ball bearings ($d < 10$ mm)

Unit : μm

Load type		Bearing tolerance class	Single plane mean bore diameter deviation Δ_{dmp}		Shaft diameter dimensional tolerance		Fit ¹⁾	Applications
			upper	lower	upper	lower

[Note] 1) Class 0 bearing : $D \leq 304.8$ mm

Table 9-8 (1) Recommended shaft fits for thrust bearings (classes 0, 6)

Load type	Shaft diameter, mm		Class of shaft tolerance range	Remarks
	over	up to		
Central axial load (generally for thrust bearings)	All shaft diameters		js 6	h 6 may also be used.
Combined load (spherical thrust roller bearing)	All shaft diameters		js 6	js 6, k 6 and m 6 may be used in place of k 6, m 6 and n 6, respectively.
	Stationary shaft race load			
	Rotating shaft race load or indeterminate direction load			
	—	200	k 6	
	200	400	m 6	
	400	—	n 6	

Table 9-8 (2) Recommended housing fits for thrust bearings (classes 0, 6)

Load type	Class of housing bore diameter tolerance range	Remarks
Central axial load (generally for thrust bearings)	—	Select such tolerance range class as provides clearance in the radial direction for housing race.
	H 8	In case of thrust ball bearings requiring high accuracy.
Combined load (spherical thrust roller bearing)	Stationary housing race load	H 7
	Indeterminate direction load or rotating housing race load	K 7
		M 7
		In case of comparably large radial load.

[Remark] This table is applicable to cast iron or steel housings.

10. Bearing internal clearance

Bearing internal clearance is defined as the total distance either inner or outer ring can be moved when the other ring is fixed.

If movement is in the radial direction, it is called radial internal clearance; if in the axial direction, axial internal clearance. (Fig. 10-1)

Bearing performance depends greatly upon internal clearance during operation (also referred to as operating clearance); inappropriate clearance results in short rolling fatigue life and generation of heat, noise or vibration.

Fig. 10-1 Bearing internal clearance

In measuring internal clearance, a specified load is generally applied in order to obtain stable measurement values.

Consequently, measured clearance values will be larger than the original clearance by the amount of elastic deformation due to the load applied for measurement.

As far as roller bearings are concerned, however, the amount of elastic deformation is negligible.

Clearance prior to mounting is generally defined as the original clearance.

10-1 Selection of internal clearance

The term "residual clearance" is defined as the original clearance decreased owing to expansion or contraction of a raceway due to fitting, when the bearing is mounted in the shaft and housing.

The term "effective clearance" is defined as the residual clearance decreased owing to dimensional change arising from temperature differentials within the bearing.

The term "operating clearance" is defined as the internal clearance present while a bearing mounted in a machine is rotating under a certain load, or, the effective clearance increased due to elastic deformation arising from bearing loads.

As illustrated in Fig. 10-2, bearing fatigue life is longest when the operating clearance is slightly negative.

However, as the operating clearance becomes more negative, the fatigue life shortens remarkably.

Thus it is recommended that bearing internal clearance be selected such that the operating clearance is slightly positive.

Fig. 10-2 Relationship between operating clearance and fatigue life

It is important to take specific operating conditions into consideration and select a clearance suitable for the conditions.

For example, when high rigidity is required, or when the noise must be minimized, the operating clearance must be reduced. On the other hand, when high operating temperature is expected, the operating clearance must be increased.

10-2 Operating clearance

Table 10-1 shows how to determine the operating clearance when the shaft and housing are made of steel.

Tables 10-2 to 10-10 show standard values for bearing internal clearance before mounting.

Table 10-11 shows examples of clearance selection excluding CN clearance.

Table 10-1 How to determine operating clearance

Operating clearance (S)	$S = S_0 - (S_f + S_{t1} + S_{t2}) + S_w^*$ * S_w (increase of clearance due to load) is generally small, and thus may be ignored, although there is an equation for determining the value.	
Decrease of clearance due to fitting (S_f)	(In the case of hollow shaft) $S_{fi} = \Delta_{deff} \frac{d}{D_i} \cdot \left(1 - \frac{d_0^2}{d^2} \right)$ (In the case of solid shaft) $S_{fi} = \Delta_{deff} \frac{d}{D_i}$	(In the case of $D_h \neq \infty$) $S_{fo} = \Delta_{deff} \frac{D_e}{D} \cdot \left(1 - \frac{D^2}{D_h^2} \right)$ (In the case of $D_h = \infty$) $S_{fo} = \Delta_{deff} \frac{D_e}{D}$
Decrease of clearance due to temperature differentials between inner and outer rings (S_{t1})	The amount of decrease varies depending on the state of housing; however, generally the amount can be approximated by the following equation on the assumption that the outer ring will not expand: $S_{t1} = \alpha (D_i \cdot t_i - D_e \cdot t_e)$	
Decrease of clearance due to temperature rise of rolling element (S_{t2})	where: $D_e = D_i + 2D_w$ Consequently, $S_{t1} + S_{t2}$ will be determined by the following equation: $S_{t1} + S_{t2} = \alpha \cdot D_i \cdot t_1 + 2 \alpha \cdot D_w \cdot t_2$ Temperature differential between the inner and outer rings, t_1, can be expressed as follows: $t_1 = t_i - t_e$ Temperature differential between the rolling element and outer ring, t_2, can be expressed as follows: $t_2 = t_w - t_e$	

In Table 10-1,

S : operating clearance	mm	Δ_{deff} : effective interference of outer ring	mm
S_0 : clearance before mounting	mm	D_h : outside diameter of housing	mm
S_f : decrease of clearance due to fitting	mm	D_e : outer ring raceway contact diameter	mm
S_{fi} : expansion of inner ring raceway contact diameter	mm	$\left(\begin{array}{l} \text{ball bearing} \cdots \cdots D_e \doteq 0.2(4D + d) \\ \text{roller bearing} \cdots D_e \doteq 0.25(3D + d) \end{array} \right)$	
S_{fo} : contraction of outer ring raceway contact diameter	mm	D : nominal outside diameter	mm
S_{t1} : decrease of clearance due to temperature differentials between inner and outer rings	mm	α : linear expansion coefficient of bearing steel (12.5×10^{-6})	1/°C
S_{t2} : decrease of clearance due to temperature rise of the rolling elements	mm	D_w : average diameter of rolling elements	mm
S_w : increase of clearance due to load	mm	$\left(\begin{array}{l} \text{ball bearing} \cdots \cdots D_w \doteq 0.3(D - d) \\ \text{roller bearing} \cdots D_w \doteq 0.25(D - d) \end{array} \right)$	
Δ_{deff} : effective interference of inner ring	mm	t_i : temperature rise of the inner ring	°C
d : nominal bore diameter (shaft diameter)	mm	t_e : temperature rise of the outer ring	°C
d_0 : bore diameter of hollow shaft	mm	t_w : temperature rise of rolling elements	°C
D_i : inner ring raceway contact diameter	mm	$\left(\begin{array}{l} \text{ball bearing} \cdots \cdots D_i \doteq 0.2(D + 4d) \\ \text{roller bearing} \cdots D_i \doteq 0.25(D + 3d) \end{array} \right)$	

- Bearings are sometimes used with a non-steel shaft or housing.
In the automotive industry, a statistical method is often incorporated for selection of clearance.
In these cases, or when other special operating conditions are involved, JTEKT should be consulted.

- [Remarks] 1. For measured clearance, the increase of radial internal clearance caused by the measurement load should be added to the values in the above table for correction. Amounts for correction are as shown below.
Of the amounts for clearance correction in the C 2 column, the smaller is applied to the minimum clearance, the larger to the maximum clearance.
2. Values in Italics are prescribed in JTEKT standards.

Table 10-11 Examples of non-standard clearance selection

Service conditions	Applications	Examples of clearance selection
In the case of heavy/impact load, large interference	Railway rolling stock axle journals	C 3
In the case of vibration/impact load, interference fit both for inner/outer rings	Shaker screens, railway rolling stock traction motors, tractor final reduction gears	C 3, C 4 C 4 C 4
When shaft deflection is large	Automobile rear wheels	C 5
When shaft and inner ring are heated	Dryers of paper making machines, table rollers of rolling mills	C 3, C 4 C 3
When clearance fit both for inner/outer rings	Roll necks of rolling mills	C 2
When noise/vibration during rotation is to be lowered	Micro-motors	C 1, C 2, CM
When clearance after mounting is to be adjusted in order to reduce shaft runout	Lathe spindles	C 9 NA, C 1 NA

[Reference] Relationship between radial internal clearance and axial internal clearance

[Deep groove ball bearing] $\Delta_a = \sqrt{\Delta_r (4m_o - \Delta_r)}$ (10-1)

[Double-row angular contact ball bearing] $\Delta_a = 2\sqrt{m_o^2 - (m_o \cos \alpha - \frac{\Delta_r}{2})^2} - 2m_o \sin \alpha$ (10-2)

[Matched pair angular contact ball bearing] $\Delta_a = 2m_o \sin \alpha - 2\sqrt{m_o^2 - (m_o \cos \alpha + \frac{\Delta_r}{2})^2}$ (10-3)

[Double/four-row and matched pair tapered roller bearing] $\Delta_a = \Delta_r \cot \alpha \div \frac{1.5}{e} \Delta_r$ (10-4)

where :

Δ_a : axial internal clearance mm

Δ_r : radial internal clearance mm

$m_o = r_e + r_i - D_w$

$\left(\begin{array}{ll} r_e : \text{outer ring raceway groove radius} & \text{mm} \\ r_i : \text{inner ring raceway groove radius} & \text{mm} \\ D_w : \text{ball diameter} & \text{mm} \end{array} \right)$

α : nominal contact angle

e : limit value of F_a/F_r

(shown in the bearing specification table.)

11. Preload

Generally, bearings are operated with a certain amount of proper clearance allowed. For some applications, however, bearings are mounted with axial load of such magnitude that the clearance will be negative.

The axial load, referred to as "preload," is often applied to angular contact ball bearings and tapered roller bearings.

11-1 Purpose of preload

- To improve running accuracy by reducing runout of shaft, as well as to heighten position accuracy in radial and axial directions.
(Bearings for machine tool spindles and measuring instruments)
- To improve gear engagement accuracy by increasing bearing rigidity.
(Bearings for automobile final reduction gears)
- To reduce smearing by eliminating sliding in irregular rotation, self-rotation, and around-the-raceway revolution of rolling elements.
(For high rotation speed angular contact ball bearings)
- To minimize abnormal noise due to vibration or resonance.
(For small electric motor bearings)
- To keep rolling elements in the right position relative to the raceway.
(For thrust ball bearings and spherical thrust roller bearings used on horizontal shafts)

11-2 Method of preloading

The preload can be done either by the position preloading or the constant pressure preloading; typical examples are given in Table 11-1.

(Comparison between position and constant pressure preloadings)

- With the same amount of preloading, the position preloading produces smaller displacement in the axial direction, and thus is liable to bring about higher rigidity.
- The constant pressure preloading produces stable preloading, or little fluctuation in the amount of preload, since the spring can absorb the load fluctuation and shaft expansion/contraction caused by temperature difference between the shaft and housing during operation.
- The position preloading can apply a larger preload.

Consequently, the position preloading is more suitable for applications requiring high rigidity, while the constant pressure preloading is more suitable for high rotational speed, vibration prevention in the axial direction, and thrust bearings used on horizontal shafts.

Table 11-1 Method of preloading

Position preloading			Constant pressure preloading
			
● Method using matched pair bearing with stand-out adjusted for preloading (see below). 	● Method using spacer with dimensions adjusted for preloading.	● Method using nut or bolt capable of adjusting preload in axial direction. (In this case, starting friction moment during adjustment should be measured so that proper preload will be applied.)	● Method using coil spring or diaphragm spring.

11-3 Preload and rigidity

For angular contact ball bearings and tapered roller bearings, the "back-to-back" arrangement is generally used to apply preload for higher rigidity.

This is because shaft rigidity is improved by the longer distance between load centers in the back-to-back arrangement.

Fig. 11-1 shows the relationship between preload given via position preloading and rigidity expressed by displacement in the axial direction of the back-to-back bearing.

- P : amount of preload (load)
- T : axial load from outside
- T_A : axial load applied to Bearing A
- T_B : axial load applied to Bearing B
- δ_a : displacement of matched pair bearing
- δ_{aA} : displacement of Bearing A
- δ_{aB} : displacement of Bearing B
- $2\delta_{ao}$: clearance between inner rings before preloading

Fig. 11-1 Preloading diagram in position preloading

In Fig. 11-1, when preload P is applied (inner ring is tightened toward the axial direction), bearings A and B are displaced by δ_{ao} respectively, and the clearance between inner rings diminishes from $2\delta_{ao}$ to zero.

The displacement when axial load T is applied to these matched pair bearings from the outside can be determined as δ_a .

[For reference]

How to determine δ_a in Fig. 11-1

- ① Determine the displacement curve of bearing A.
- ② Determine the displacement curve of bearing B. ...Symmetrical curve in relation to horizontal axis intersecting vertical line of preload P at point x .
- ③ With the load from outside defined as T , determine line segment $x-y$ on the horizontal line passing through point x . Displace segment $x-y$ in parallel along the displacement curve of bearing B. Determine point y' at which to intersect displacement curve of bearing A.
- ④ δ_a can be determined as the distance between line segments $x'-y'$ and $x-y$.

Fig. 11-2 shows the relationship between preload and rigidity in the constant pressure preloading using the same matched pair bearings as in Fig. 11-1.

In this case, since the spring rigidity can be ignored, the matched pair bearing shows almost the same rigidity as a separate bearing with preload P applied in advance.

Fig. 11-2 Preloading diagram in constant pressure preloading

11-4 Amount of preload

The amount of preload should be determined, to avoid an adverse effect on bearing life, temperature rise, friction torque, or other performance characteristic, in view of the bearing application.

Decrease of preload due to wear-in, accuracy of the shaft and housing, mounting conditions, and lubrication should also be fully considered in determining preload.

11-4-1 Preload amount of matched pair angular contact ball bearings

Table 11-2 shows standard preload for matched pair angular contact ball bearings of JIS class 5 or higher used for machine tool spindles or other higher precision applications.

JTEKT offers four types of standard preload: slight preload (S), light preload (L), medium preload (M), and heavy preload (H), so that preload can be selected properly and easily for various applications.

Generally, light or medium preload is recommended for grinder spindles, and medium or heavy preload for spindles of lathes and milling machines.

Table 11-3 shows recommended fits of high-precision matched pair angular contact ball bearings used with light or medium preload applied.

Table 11-3 Recommended fits for high-precision matched pair angular contact ball bearings with preload applied

11-4-2 Amount of preload for thrust ball bearings

When a thrust ball bearing is rotated at high speed, balls slide on raceway due to centrifugal force and the gyro moment, which often causes the raceway to suffer from smearing or other defects.

To eliminate such sliding, it is necessary to mount the bearing without clearance, and apply an axial load (preload) larger than the minimum necessary axial load determined by the following equation.

When an axial load from the outside is lower than $0.001\ 3\ C_{0a}$, there is no adverse effect on the bearing, as long as lubrication is satisfactory.

Generally, deep groove and angular contact ball bearings are recommended for applications when a portion of rotation under axial load is present at high speed.

11-4-3 Amount of preload for spherical thrust roller bearings

Spherical thrust roller bearings sometimes suffer from scuffing, smearing, or other defects due to sliding which occurs between the roller and raceway surface in operation.

To eliminate such sliding, it is necessary to mount the bearing without clearance, and apply an axial load (preload) larger than the minimum necessary axial load.

Of the two values determined by the two equations below, the higher should be defined as the minimum necessary axial load.

- Thrust ball bearing (contact angle : 90°)

$$F_{a\ min} = 5.1 \left(\frac{n}{1\ 000} \right)^2 \cdot \left(\frac{C_{0a}}{1\ 000} \right)^2 \times 10^{-3} \quad (11-1)$$

- Spherical thrust roller bearing (the higher value determined by the two equations should be taken.)

$$F_{a\ min} = \frac{C_{0a}}{2\ 000} \quad (11-2)$$

$$F_{a\ min} = 1.8F_r + 1.33 \left(\frac{n}{1\ 000} \right)^2 \cdot \left(\frac{C_{0a}}{1\ 000} \right)^2 \times 10^{-4} \quad (11-3)$$

where :

$F_{a\ min}$: minimum necessary axial load	N
n : rotational speed	min^{-1}
C_{0a} : static axial load rating	N
F_r : radial load	N

12. Bearing lubrication

12-1 Purpose and method of lubrication

Lubrication is one of the most important factors determining bearing performance. The suitability of the lubricant and lubrication method have a dominant influence on bearing life.

Functions of lubrication :

- To lubricate each part of the bearing, and to reduce friction and wear
- To carry away heat generated inside bearing due to friction and other causes
- To cover rolling contact surface with the proper oil film in order to prolong bearing fatigue life
- To prevent corrosion and contamination by dirt

Bearing lubrication is classified broadly into two categories: grease lubrication and oil lubrication. Table 12-1 makes a general comparison between the two.

Table 12-1 Comparison between grease and oil lubrication

Item	Grease	Oil
• Sealing device	Simple	Slightly complicated and special care required for maintenance
• Lubricating ability	Good	Excellent
• Rotation speed	Low/medium speed	Applicable at high speed as well
• Replacement of lubricant	Slightly troublesome	Effective
• Life of lubricant	Relatively short	Long
• Cooling effect	No cooling effect	Good (circulation is necessary)
• Filtration of dirt	Difficult	Easy

12-1-1 Grease lubrication

Grease lubrication is widely applied since there is no need for replenishment over a long period once grease is filled, and a relatively simple structure can suffice for the lubricant sealing device.

There are two methods of grease lubrication. One is the closed lubrication method, in which grease is filled in advance into shielded/sealed bearing; the other is the feeding method, in which the bearing and housing are filled with grease in proper quantities at first, and refilled at a regular interval via replenishment or replacement.

Devices with numerous grease inlets sometimes employ the centralized lubricating method, in which the inlets are connected via piping and supplied with grease collectively.

1) Amount of grease

In general, grease should fill approximately one-third to one-half the inside space, though this varies according to structure and inside space of housing.

It must be borne in mind that excessive grease will generate heat when churned, and will consequently alter, deteriorate, or soften.

When the bearing is operated at low speed, however, the inside space is sometimes filled with grease to two-thirds to full, in order to preclude infiltration of contaminants.

2) Replenishment/replacement of grease

The method of replenishing/replacing grease depends largely on the lubrication method. Whichever method may be utilized, care should be taken to use clean grease and to keep dirt or other foreign matter out of the housing.

In addition, it is desirable to refill with grease of the same brand as that filled at the start.

When grease is refilled, new grease must be injected inside bearing.

Fig. 12-1 gives one example of a feeding method.

Fig. 12-1 Example of grease feeding method (using grease sector)

In the example, the inside of the housing is divided by grease sectors. Grease fills one sector, then flows into the bearing.

On the other hand, grease flowing back from the inside is forced out of the bearing by the centrifugal force of the grease valve.

When the grease valve is not used, it is necessary to enlarge the housing space on the discharge side to store old grease.

The housing is uncovered and the stored old grease is removed at regular intervals.

3) Grease feeding interval

In normal operation, grease life should be regarded roughly as shown in Fig. 12-2, and replenishment/replacement should be carried out accordingly.

[Notes] 1) [A] : radial ball bearing

[B] : cylindrical roller bearing, needle roller bearing

[C] : tapered roller bearing, spherical roller bearing, thrust ball bearing

2) Temperature correction

When the bearing operating temperature exceeds 70°C, t_f' , obtained by multiplying t_f by correction coefficient a , found on the scale below, should be applied as the feeding interval.

$$t_f' = t_f \times a$$

Temperature correction coefficient a

Bearing operating temperature T °C

Fig. 12-2 Grease feeding interval

4) Grease life in shielded/sealed ball bearing

Grease life can be estimated by the following equation when a single-row deep groove ball bearing is filled with grease and sealed with shields or seals.

$$\log L = 6.10 - 4.40 \times 10^{-6} d_m n - 3.125 \left(\frac{P_r}{C_r} - 0.04 \right) - (0.021 - 1.80 \times 10^{-8} d_m n) T \quad (12-1)$$

where :

L : grease life h

$$d_m = \frac{D + d}{2} \quad (D : \text{outside diameter}, d : \text{bore diameter}) \quad \text{mm}$$

n : rotational speed min^{-1}

P_r : dynamic equivalent radial load N

C_r : basic dynamic radial load rating N

T : operating temperature of bearing $^{\circ}\text{C}$

The conditions for applying equation (12-1) are as follows :

a) Operating temperature of bearing : T °C

Applicable when $T \leq 120$

$\left(\text{when } T < 50, \right.$
 $\left. T = 50 \right)$

When $T > 120$, please contact with JTEKT.

c) Load condition : $\frac{P_r}{C_r}$

Applicable when $\frac{P_r}{C_r} \leq 0.16$

$\left(\text{when } \frac{P_r}{C_r} < 0.04, \right.$
 $\left. \frac{P_r}{C_r} = 0.04 \right)$

b) Value of $d_m n$

Applicable when $d_m n \leq 500 \times 10^3$

$\left(\text{when } d_m n < 125 \times 10^3, \right.$
 $\left. d_m n = 125 \times 10^3 \right)$

When $d_m n > 500 \times 10^3$, please contact with JTEKT.

When $\frac{P_r}{C_r} > 0.16$, please contact with JTEKT.

12-1-2 Oil lubrication

Oil lubrication is usable even at high speed rotation and somewhat high temperature, and is effective in reducing bearing vibration and noise.

Thus oil lubrication is used in many cases where grease lubrication does not work.

Table 12-2 shows major types and methods of oil lubrication.

Table 12-2 Type and method of oil lubrication

① Oil bath	• Simplest method of bearing immersion in oil for operation. • Suitable for low/medium speed. • Oil level gauge should be furnished to adjust the amount of oil. (In the case of horizontal shaft) About 50 % of the lowest rolling element should be immersed. (In the case of vertical shaft) About 70 to 80 % of the bearing should be immersed. • It is better to use a magnetic plug to prevent wear iron particles from dispersing in oil.	
② Oil drip	• Oil is dripped with an oiling device, and the inside of the housing is filled with oil mist by the action of rotating parts. This method has a cooling effect. • Applicable at relatively high speed and up to medium load. • In general, 5 to 6 drops of oil are utilized per minute. (It is difficult to adjust the dripping in 1mL/h or smaller amounts.) • It is necessary to prevent too much oil from being accumulated at the bottom of housing.	
③ Oil splash	• This type of lubrication method makes use of a gear or simple flinger attached to shaft in order to splash oil. This method can supply oil for bearings located away from the oil tank. • Usable up to relatively high speed. • It is necessary to keep oil level within a certain range. • It is better to use a magnetic plug to prevent wear iron particles from dispersing in oil. It is also advisable to set up a shield or baffle board to prevent contaminants from entering the bearing.	

④ Forced oil circulation	• This method employs a circulation-type oil supply system. Supplied oil lubricates inside of the bearing, is cooled and sent back to the tank through an oil escape pipe. The oil, after filtering and cooling, is pumped back. • Widely used at high speeds and high temperature conditions. • It is better to use an oil escape pipe approximately twice as thick as the oil supply pipe in order to prevent too much lubricant from gathering in housing. • Required amount of oil : see Remark 1.	
⑤ Oil jet lubrication	• This method uses a nozzle to jet oil at a constant pressure (0.1 to 0.5MPa), and is highly effective in cooling. • Suitable for high speed and heavy load. • Generally, the nozzle (diameter 0.5 to 2 mm) is located 5 to 10 mm from the side of a bearing. When a large amount of heat is generated, 2 to 4 nozzles should be used. • Since a large amount of oil is supplied in the jet lubrication method, old should be discharged with an oil pump to prevent excessive residual oil. • Required amount of oil : see Remark 1.	
⑥ Oil mist lubrication (spray lubrication)	• This method employs an oil mist generator to produce dry mist (air containing oil in the form of mist). The dry mist is continuously sent to the oil supplier, where the mist is turned into a wet mist (sticky oil drops) by a nozzle set up on the housing or bearing, and is then sprayed onto bearing. • Required amount of mist : see Remark 2.	(Example of grinding machine) (Example of rolling mill)

⑦ Oil/air lubrication

- A proportioning pump sends forth a small quantity of oil, which is mixed with compressed air by a mixing valve. The admixture is supplied continuously and stably to the bearing.
- This method enables quantitative control of oil in extremely small amounts, always supplying new lubricating oil. It is thus suitable for machine tools and other applications requiring high speed.
- Compressed air and lubricating oil are supplied to the spindle, increasing the internal pressure and helping prevent dirt, cutting-liquid, etc. from entering. As well, this method allows the lubricating oil to flow through a feeding pipe, minimizing atmospheric pollution.
- JTEKT produces an oil/air lubricator and, air cleaner, as well as a spindle unit incorporating the oil/air lubrication system. Please refer to brochure "oil/air lubricator & air clean unit".

Remark 1 Required oil supply in forced oil circulation ; oil jet lubrication methods

$$G = \frac{1.88 \times 10^{-4} \mu \cdot d \cdot n \cdot P}{60 \cdot c \cdot r \cdot \Delta T}$$

where :

G : required oil supply	L/min
μ : friction coefficient (see table at right)	
d : nominal bore diameter	mm
n : rotational speed	min ⁻¹
P : dynamic equivalent load of bearing	N
c : specific heat of oil	1.88-2.09kJ/kg·K
r : density of oil	g/cm ³
ΔT : temperature rise of oil	K

Values of friction coefficient μ

Bearing type	μ
Deep groove ball bearing	0.001 0 – 0.001 5
Angular contact ball bearing	0.001 2 – 0.002 0
Cylindrical roller bearing	0.000 8 – 0.001 2
Tapered roller bearing	0.001 7 – 0.002 5
Spherical roller bearing	0.002 0 – 0.002 5

The values obtained by the above equation show quantities of oil required to carry away all the generated heat, with heat release not taken into consideration.

In reality, the oil supplied is generally half to two-thirds of the calculated value.

Heat release varies widely according to the application and operating conditions.

To determine the optimum oil supply, it is advised to start operating with two-thirds of the calculated value, and then reduce the oil gradually while measuring the operating temperature of bearing, as well as the supplied and discharged oil.

Remark 2 Notes on oil mist lubrication

- 1) Required amount of mist
(mist pressure : 5 kPa)

$$\text{(In the case of a bearing)} \quad Q = 0.11dR$$

$$\text{(In the case of two oil seals combined)} \quad Q = 0.028d_1$$

where :

Q : required amount of mist	L/min
d : nominal bore diameter	mm
R : number of rolling element rows	
d_1 : inside diameter of oil seal	mm

In the case of high speed ($d_m n \geq 400 \times 10^3$), it is necessary to increase the amount of oil and heighten the mist pressure.

- 2) Piping diameter and design of lubrication hole/groove

When the flow rate of mist in piping exceeds 5 m/s, oil mist suddenly condenses into an oil liquid.

Consequently, the piping diameter and dimensions of the lubrication hole/groove in the housing should be designed to keep the flow rate of mist, obtained by the following equation, from exceeding 5 m/s.

$$V = \frac{0.167Q}{A} \leq 5$$

where :

V : flow rate of mist	m/s
Q : amount of mist	L/min
A : sectional area of piping or lubrication groove	cm ²

- 3) Mist oil

Oil used in oil mist lubrication should meet the following requirements.

- ability to turn into mist
- has high extreme pressure resistance
- good heat/oxidation stability
- rust-resistant
- unlikely to generate sludge
- superior demulsifier

Oil mist lubrication has a number of advantages for high speed rotation bearings. Its performance, however, is largely affected by surrounding structures and bearing operating conditions.

If contemplating the use of this method, please contact with JTEKT for advice based on JTEKT long experience with oil mist lubrication.

12-2 Lubricant

12-2-1 Grease

Grease is made by mixing and dispersing a solid of high oil-affinity (called a thickener) with lubricant oil (as a base), and transforming it into a semi-solid state.

As well, a variety of additives can be added to improve specific performance.

(1) Base oil

Mineral oil is usually used as the base oil for grease. When low temperature fluidity, high temperature stability, or other special performance is required, diester oil, silicon oil, polyglycolic oil, fluorinated oil, or other synthetic oil is often used.

Generally, grease with a low viscosity base oil is suitable for applications at low temperature or high rotation speed; grease with high viscosity base oils are suitable for applications at high temperature or under heavy load.

(2) Thickener

Most greases use a metallic soap base such as lithium, calcium, or sodium as thickeners. For some applications, however, non-soap base thickeners (inorganic substances such as bentone, silica gel, and organic substances such as urea compounds, fluorine compounds) are also used.

In general, the mechanical stability, bearing operating temperature range, water resistance, and other characteristics of grease are determined by the thickener.

(Lithium soap base grease)

Superior in heat resistance, water resistance and mechanical stability.

(Calcium soap base grease)

Superior in water resistance; inferior in heat resistance.

(Sodium soap base grease)

Superior in heat resistance; inferior in water resistance.

(Non-soap base grease)

Superior in heat resistance.

(3) Additives

Various additives are selectively used to serve the respective purposes of grease applications.

• Extreme pressure agents

When bearings must tolerate heavy or impact loads.

• Oxidation inhibitors

When grease is not refilled for a long period.

Structure stabilizers, rust preventives, and corrosion inhibitors are also used.

(4) Consistency

Consistency, which indicates grease hardness, is expressed as a figure obtained, in accordance with ASTM (JIS), by multiplication by 10 the depth (in mm) to which the cone-shaped metallic plunger penetrates into the grease at 25°C by deadweight in 5 seconds. The softer the grease, the higher the figure.

Table 12-4 shows the relationships between the NLGI scales and ASTM (JIS) penetration indexes, service conditions of grease.

(NLGI : National Lubricating Grease Institute)

Table 12-4 Grease consistency

NLGI scale	ASTM (JIS) penetration index (25°C, 60 mixing operations)	Service conditions/applications
0	355 – 385	For centralized lubricating
1	310 – 340	For centralized lubricating, at low temperature
2	265 – 295	For general use
3	220 – 250	For general use, at high temperature
4	175 – 205	For special applications

(5) Mixing of different greases

Since mixing of different greases changes their properties, greases of different brands should not be mixed.

If mixing cannot be avoided, greases containing the same thickener should be used. Even if the mixed greases contain the same thickener, however, mixing may still produce adverse effects, due to difference in additives or other factors.

Thus it is necessary to check the effects of a mixture in advance, through testing or other methods.

Table 12-3 Characteristics of respective greases

	Lithium grease			Calcium grease (cup grease)	Sodium grease (fiber grease)		Complex base grease		Non-soap base grease			
Thickener	Lithium soap			Calcium soap	Sodium soap		Lithium complex soap	Calcium complex soap	Bentone	Urea compounds	Fluorine compounds	Thickener
Base oil	Mineral oil	Synthetic oil (diester oil)	Synthetic oil (silicon oil)	Mineral oil	Mineral oil		Mineral oil	Mineral oil	Mineral oil	Mineral/synthetic oil	Synthetic oil	Base oil
Dropping point (°C)	170 to 190	170 to 230	220 to 260	80 to 100	160 to 180		250 or higher	200 to 280	–	240 or higher	250 or higher	Dropping point (°C)
Operating temperature range (°C)	– 30 to + 120	– 50 to + 130	– 50 to + 180	– 10 to + 70	0 to + 110		– 30 to + 150	– 10 to + 130	– 10 to + 150	– 30 to + 150	– 40 to + 250	Operating temperature range (°C)
Rotation speed range	Medium to high	High	Low to medium	Low to medium	Low to high		Low to high	Low to medium	Medium to high	Low to high	Low to medium	Rotation speed range
Mechanical stability	Excellent	Good to excellent	Good	Fair to good	Good to excellent		Good to excellent	Good	Good	Good to excellent	Good	Mechanical stability
Water resistance	Good	Good	Good	Good	Bad		Good to excellent	Good	Good	Good to excellent	Good	Water resistance
Pressure resistance	Good	Fair	Bad to fair	Fair	Good to excellent		Good	Good	Good to excellent	Good to excellent	Good	Pressure resistance
Remarks	Most widely usable for various rolling bearings.	Superior low temperature and friction characteristics. Suitable for bearings for measuring instruments and extra-small ball bearings for small electric motors.	Superior high and low temperature characteristics.	Suitable for applications at low rotation speed and under light load. Not applicable at high temperature.	Liable to emulsify in the presence of water. Used at relatively high temperature.		Superior mechanical stability and heat resistance. Used at relatively high temperature.	Superior pressure resistance when extreme pressure agent is added. Used in bearings for rolling mills.	Suitable for applications at high temperature and under relatively heavy load.	Superior water resistance, oxidation stability, and heat stability. Suitable for applications at high temperature and high speed.	Superior chemical resistance and solvent resistance. Usable at up to 250 °C.	Remarks

Table 12-5 Typical examples of standard grease for JTEKT bearings

Grease name	Thickener	Base oil	Appearance	Consistency 60W			NLGI scale	Operating temperature range (°C)	Application examples	
				Unworked	Worked					
Alvania 2	Lithium	Mineral oil	Grayish brown	276	275		2	-10 – 100	Automobile	Steering column
Raremax AF-I	Urea	Mineral oil	Pale yellow, viscous	–	300		1 – 2 ²⁾	0 – 150		Wheel (hub unit)
FS841	Fluororesin	Fluorosilicone oil	White	–	290		2	-40 – 220		Fan coupling
Sunlight 2	Lithium	Mineral oil	Yellowish brown	–	280		2	-10 – 100		Universal joint (shell type), steering joint
Unirex N3	Lithium complex	Mineral oil	Green	–	235		3	-10 – 130		Clutch release
W191	Urea	PAO ¹⁾ , mineral oil	Pale yellow	247	275		2	-30 – 130		Water pump bearing
Alumix HD	Aluminum complex	Mineral oil	Light brown	–	325		1	-20 – 180	Steel production	Conveyor
Emalube L	Urea	Mineral oil	Light brown, viscous	–	350		0 – 1 ²⁾	-10 – 200		Continuous casting machine
Palmax RBG	Special lithium complex	Mineral oil	Yellow, viscous	–	300		1 – 2 ²⁾	-10 – 150		Rolling mill roll neck
4B grease	Carbon black	Ethyl oil	Black	–	260		2 – 3 ²⁾	-30 – 250	Extra-small/miniature ball bearings	Photocopier (high temperature/conductive), printer (high temperature/conductive)
KRYTOX GPL 226	Fluororesin	Fluorinated oil		–	280		2	0 – 250		Photocopier (high temperature), printer (high temperature)
Multemp PSNo.2	Lithium	Mineral oil, ester oil	Pinkish white, viscous	–	275		2	-40 – 100		Motor (for low temperatures)
KVC grease	Urea	PAO ¹⁾ , ester oil	Milkish pink	–	244		3	-30 – 150		Motor (for high temperatures), rotary encoder, fan motor (for high temperatures)
SR grease	Lithium	Ester oil	Light brown, viscous	–	250		3	-40 – 130	Extra-small/miniature ball bearings, automobile	Motor, stepping motor, fan motor
EX grease	Fluororesin (PTFE)	Fluorinated oil	White	–	260		2 – 3 ²⁾	-30 – 200	Semiconductor manufacturing equipment	Center bearing (for propeller shafts), steering column
KHD	Lithium	PAO ¹⁾	White	–	199		4	-30 – 120		For high temperatures, for clean environment, for vacuum environment
Nerita 2858	Lithium	Mineral oil (XHVI)	Yellowish brown	–	279		2	-30 – 100	Railway rolling stock	For room temperature, for atmosphere
Arapen RB 320	Lithium, calcium	Mineral oil	Yellowish brown	–	315		1	-30 – 90		Axle journal (ABU)
Isoflex NBU 15	Barium complex	Ester oil	Beige	270	280		2	-40 – 100	Machine tool spindle	Axle journal (general)
Shell Cassida grease RLS2	Aluminum complex	PAO ¹⁾	Transparent	–	280		2	-20 – 100	For food machinery	
Alvania EP2	Lithium	Mineral oil	Brown	282	276		2	-10 – 80	Slewing rim, automobile	Universal joint, king pin thrust bearing
Alvania 3	Lithium	Mineral oil	Brown	240	225		3	-10 – 100	Agricultural machinery	

[Notes] 1) PAO: Polyalphaolefin oil

2) The value is within the range specified by the consistency numbers.

12-2-2 Lubricating oil

For lubrication, bearings usually employ highly refined mineral oils, which have superior oxidation stability, rust preventive effect, and high film strength.
With bearing diversification, however, various synthetic oils have been put into use.

These lubricating oils contain various additives (oxidation inhibitors, rust preventives, antifoaming agents, etc.) to improve specific properties. Table 12-6 shows the characteristics of lubricating oils.
Mineral lubricating oils are classified by applications in JIS and MIL.

Table 12-6 Characteristics of lubricating oils

Type of lubricating oil	Highly refined mineral oil	Major synthetic oils				
		Diester oil	Silicon oil	Polyglycolic oil	Polyphenyl ether oil	Fluorinated oil
Operating temperature range (°C)	− 40 to + 220	− 55 to + 150	− 70 to + 350	− 30 to + 150	0 to + 330	− 20 to + 300
Lubricity	Excellent	Excellent	Fair	Good	Good	Excellent
Oxidation stability	Good	Good	Fair	Fair	Excellent	Excellent
Radioactivity resistance	Bad	Bad	Bad to fair	Bad	Excellent	—

[Selection of lubricating oil]

The most important criterion in selecting a lubricating oil is whether the oil provides proper viscosity at the bearing operating temperature.
Standard values of proper kinematic viscosity can be obtained through selection by bearing type according to Table 12-7 first, then through selection by bearing operating conditions according to Table 12-8.

When lubricating oil viscosity is too low, the oil film will be insufficient. On the other hand, when the viscosity is too high, heat will be generated due to viscous resistance.
In general, the heavier the load and the higher the operating temperature, the higher the lubricating oil viscosity should be ; whereas, the higher the rotation speed, the lower the viscosity should be.
Fig. 12-3 illustrates the relationship between lubricating oil viscosity and temperature.

Table 12-7 Proper kinematic viscosity by bearing type

Bearing type	Proper kinematic viscosity at operating temperature
Ball bearing Cylindrical roller bearing	13mm ² /s or higher
Tapered roller bearing Spherical roller bearing	20mm ² /s or higher
Spherical thrust roller bearing	32mm ² /s or higher

Table 12-8 Proper kinematic viscosities by bearing operating conditions

Operating temperature	$d_m n$ value	Proper kinematic viscosity (expressed in the ISO viscosity grade or the SAE No.)	
		Light/normal load	Heavy/impact load
− 30 to 0°C	All rotation speeds	ISO VG 15, 22, 46 (Refrigerating machine oil)	---
0 to 60°C	300 000 or lower	ISO VG 46 (Bearing oil Turbine oil)	ISO VG 68 SAE 30 (Bearing oil Turbine oil)
	300 000 to 600 000	ISO VG 32 (Bearing oil Turbine oil)	ISO VG 68 (Bearing oil Turbine oil)
	600 000 or higher	ISO VG 7, 10, 22 (Bearing oil)	---
60 to 100°C	300 000 or lower	ISO VG 68 (Bearing oil)	ISO VG 68, 100 SAE 30 (Bearing oil)
	300 000 to 600 000	ISO VG 32, 46 (Bearing oil Turbine oil)	ISO VG 68 (Bearing oil Turbine oil)
	600 000 or higher	ISO VG 22, 32, 46 (Bearing oil Turbine oil Machine oil)	---
100 to 150°C	300 000 or lower	ISO VG 68, 100 SAE 30, 40 (Bearing oil)	ISO VG 100 to 460 (Bearing oil Gear oil)
	300 000 to 600 000	ISO VG 68 SAE 30 (Bearing oil Turbine oil)	ISO VG 68, 100 SAE 30, 40 (Bearing oil)

[Remarks] 1. $d_m n = \frac{D+d}{2} \times n \cdots \{ D : \text{nominal outside diameter (mm)}, d : \text{nominal bore diameter (mm)}, n : \text{rotational speed (min}^{-1}) \}$
2. Refer to refrigerating machine oil (JIS K 2211), turbine oil (JIS K 2213), gear oil (JIS K 2219), machine oil (JIS K 2238) and bearing oil (JIS K 2239).
3. Please contact with JTEKT if the bearing operating temperature is under −30°C or over 150°C .

Fig. 12-3 Relationship between lubricating oil viscosity and temperature (viscosity index :100)

13. Bearing materials

Bearing materials include steel for bearing rings and rolling elements, as well as steel sheet, steel, copper alloy and synthetic resins for cages.

These bearing materials should possess the following characteristics :

1) High elasticity, durable under high partial contact stress.	} Bearing rings
2) High strength against rolling contact fatigue due to large repetitive contact load.	
3) Strong hardness	} Rolling elements
4) High abrasion resistance	
5) High toughness against impact load	} Bearing rings Rolling elements Cages
6) Excellent dimensional stability	

13-1 Bearing rings and rolling elements materials

1) High carbon chromium bearing steel

High carbon chromium bearing steel specified in JIS is used as a general material in bearing rings (inner rings, outer rings) and rolling elements (balls, rollers).

Their chemical composition classified by steel type is given in Table 13-1.

Among these steel types, SUJ 2 is generally used. SUJ 3, which contains additional Mn and Si, possesses high hardenability and is commonly used for thick section bearings.

SUJ 5 has increased hardenability, because it was developed by adding Mo to SUJ 3.

For small and medium size bearings, SUJ 2 and SUJ 3 are used, and for large size and extra-large size bearings with thick sections, SUJ 5 is widely used.

Generally, these materials are processed into the specified shape and then undergo hardening and annealing treatment until they attain a hardness of 57 to 64 HRC.

2) Case carburizing bearing steel (case hardened steel)

When a bearing receives heavy impact loads, the surface of the bearing should be hard and the inside soft.

Such materials should possess a proper amount of carbon, dense structure, and carburizing case depth on their surface, while having proper hardness and fine structure internally.

For this purpose, chromium steel and nickel-chromium-molybdenum steel are used as materials.

Typical steel materials are shown in Table 13-2.

3) Steel for Standard JTEKT Specification Bearings

In general terms, it is known that the non-metallic inclusions contained in materials are harmful to the rolling contact fatigue life.

At JTEKT, to reduce the amount of non-metallic inclusions, which are harmful to the fatigue life, we set the chemical compounds of the bearing steel in a proprietary manner. As a result, JTEKT standard bearings have a life that is approximately twice as long as the general bearings that are targeted by JIS B 1518 (and ISO 281).

Therefore, the basic dynamic load ratings of JTEKT standard bearings are 1.25 times the dynamic load ratings established in JIS B 1518 (and ISO 281).

This steel for standard JTEKT specification bearings is not applied to the special application bearings in this general catalog. If you require special application bearings with long lives, contact JTEKT.

4) Other

For special applications, the special heat treatment shown below can be used according to various usage conditions.

[Extremely high reliability]

· SH bearings

· By using the heat treatment technology developed by JTEKT to perform special heat treatment on high carbon chromium bearing steel, we have improved the surface hardness of these products and provided them with compressive residual stress, which has led to high reliability especially in terms of resistance to foreign matter.

· KE bearings

· By using the heat treatment technology developed by JTEKT to perform special heat treatment on carburized bearing steel, we have improved the surface hardness of these products and adjusted their amount of residual austenite, which has led to high reliability especially in terms of resistance to foreign matter.

[Remark] As for bearings which are induction hardened, carbon steel with a high carbon content of 0.55 to 0.65 % is used in addition to those listed in this table.

13-2 Materials used for cages

Since the characteristics of materials used for cages greatly influence the performance and reliability of rolling bearings, the choice of materials is of great importance.

It is necessary to select cage materials in accordance with required shape, ease of lubrication, strength, and abrasion resistance.

Typical materials used for metallic cages are shown in Tables 13-3 and 13-4.

In addition, phenolic resin machined cages and other synthetic resin molded cages are often used.

Materials typically used for molded cages are polyacetal, polyamide (Nylon 6.6, Nylon 4.6), and polymer containing fluorine, which are strengthened with glass and carbon fibers.

Table 13-3 Chemical compositions of pressed cage steel sheet (A) and machined cage carbon steel (B)

14. Shaft and housing design

In designing the shaft and housing, the following should be taken into consideration.

- 1) Shafts should be thick and short.
(in order to reduce distortion including deflection)
 - 2) Housings should possess sufficient rigidity.
(in order to reduce distortion caused by load)
- [Note] · For light alloy housings, rigidity may be provided by inserting a steel bushing.

Fig. 14-1 Example of light alloy housing

- 3) The fitting surfaces of the shaft and housing should be finished in order to acquire the required accuracy and roughness. The shoulder end-face should be finished in order to be perpendicular to the shaft center or housing bore surface. (refer to Table 14-1)
 - 4) The fillet radius (r_a) should be smaller than chamfer dimension of the bearing.
(refer to Tables 14-2, 14-3)
- [Notes] · Generally it should be finished so as to form a simple circular arc.
(refer to Fig. 14-2)
- When the shaft is given a ground finish, a recess may be provided.
(Fig. 14-3)

Fig. 14-2 Fillet radius

Fig. 14-3 Grinding undercut

- 5) The shoulder height (h) should be smaller than the outside diameter of inner ring and larger than bore diameter of outer ring so that the bearing is easily dismounted. (refer to Fig. 14-2 and Table 14-2)
- 6) If the fillet radius must be larger than the bearing chamfer, or if the shaft/housing shoulder must be low/high, insert a spacer between the inner ring and shaft shoulder as shown in Fig. 14-4, or between the outer ring and the housing shoulder.

Fig. 14-4 Example of shaft with spacer

- 7) Screw threads and locknuts should be completely perpendicular to shaft axis. It is desirable that the tightening direction of threads and locknuts be opposite to the shaft rotating direction.
- 8) When split housings are used, the surfaces where the housings meet should be finished smoothly and provided with a recess at the inner ends of the surfaces that meet.

Fig. 14-5 Recesses on meeting surfaces

14-1 Accuracy and roughness of shafts and housings

The fitting surface of the shaft and housing may be finished by turning or fine boring when the bearing is used under general operating conditions. However, if the conditions require minimum vibration and noise, or if the bearing is used under severe operating conditions, a ground finish is required.

Recommended accuracy and roughness of shafts and housings under general conditions are given in Table 14-1.

Table 14-1 Recommended accuracy and roughness of shafts and housings

Item	Bearing class	Shaft	Housing bore
Roundness tolerance	classes 0, 6	IT3 - IT4 2 - 2	IT4 - IT5 2 - 2
	classes 5, 4	IT2 - IT3 2 - 2	IT2 - IT3 2 - 2
Cylindrical form tolerance	classes 0, 6	IT3 - IT4 2 - 2	IT4 - IT5 2 - 2
	classes 5, 4	IT2 - IT3 2 - 2	IT2 - IT3 2 - 2
Shoulder runout tolerance	classes 0, 6	IT 3	IT 3 - IT 4
	classes 5, 4	IT 3	IT 3
Roughness of fitting surfaces μm	Small size bearings	0.8	1.6
	Large size bearings	1.6	3.2

[Remark] IT grade is a tolerance for its diameter. 1/2 of the IT tolerance is recommended as the "roundness" and "cylindricity" on the basis of radius.

Table 14-2 Shaft/housing fillet radius and shoulder height of radial bearings

Unit : mm

[Notes]

- Shoulder heights greater than those specified in the Table are required to accommodate heavy axial loads.
- Used when an axial load is small. These values are not recommended for tapered roller bearings, angular contact ball bearings, or spherical roller bearings.

[Remark] Fillet radius can be applied to thrust bearings.

14-2 Mounting dimensions

Mounting dimensions mean the necessary dimensions to mount bearings on shafts or housings, which include the fillet radius or shoulder diameters.

Standard values are shown in Table 14-2. (The mounting related dimensions of each bearing are given in the bearing specification table.)

The grinding undercut dimensions for ground shafts are given in Table 14-3.

For thrust bearings, the mounting dimensions should be carefully determined such that bearing race will be perpendicular to the support and the supporting area will be wide enough.

For thrust ball bearings, the shaft shoulder diameter d_a should be larger than pitch diameter of ball set, while the shoulder diameter of housing D_a should be smaller than the pitch diameter of ball set. (Fig. 14-6)

For thrust roller bearings, the housing/shaft diameter D_a/d_a should cover the lengths of both rollers. (Fig. 14-7)

Fig. 14-6 Thrust ball bearings

Fig. 14-7 Spherical thrust roller bearings

Table 14-3 Grinding undercut dimensions for ground shafts

Unit : mm

Chamfer dimension of inner ring $r_{\min}$	Grinding undercut dimensions		
	t	r_g	b
1	0.2	1.3	2
1.1	0.3	1.5	2.4
1.5	0.4	2	3.2
2	0.5	2.5	4
2.1	0.5	2.5	4
3	0.5	3	4.7
4	0.5	4	5.9
5	0.6	5	7.4
6	0.6	6	8.6
7.5	0.6	7	10

14-3 Shaft design

When bearings are mounted on shafts, locating method should be carefully determined. Shaft design examples for cylindrical bore bearings are given in Table 14-4, and those for bearings with a tapered bore in Table 14-5.

Table 14-4 Mounting designs for cylindrical bore bearings

(a) Shaft locknut	(b) End plate	(c) Locating snap ring
		
Lockwashers are used to prevent loosening of locknuts. When tapered roller bearings or angular contact ball bearings are transition-fitted to shafts, plain washers several mm thick as shown above (at right) should be added and tightened with nut.	End of shaft should have bolt holes.	Used when the housing inside is limited, or to simplify shaft machining.

Table 14-5 Mounting designs for bearings with tapered bore

(d) Adapter assembly	(e) Withdrawal sleeve	(f) Shaft locknut	(g) Split ring
			
The simplest method for axial positioning is just to attach an adapter sleeve to the shaft and tighten the locknuts. To prevent locknut loosening, lock-washer (not more than 180 mm in shaft diameter) or lock plate (not less than 200 mm in shaft diameter) are used.	The locknut (above) or end plate (below) fixes the bearing with a withdrawal sleeve, which makes it easy to dismount the bearing.	The shaft is threaded in the same way as shown in Fig. (a). The bearing is located by tightening locknut.	A split ring with threaded outside diameter is inserted into groove on the tapered shaft. A key is often used to prevent the locknut and split ring from loosening.

14-4 Sealing devices

Sealing devices not only prevent foreign matter (dirt, water, metal powder) from entering, but prevent lubricant inside from leaking. If the sealing device fails to function satisfactorily, foreign matter or leakage will cause bearing damage as a result of malfunction or seizure.

Therefore, it is necessary to design or choose the most suitable sealing devices as well as to choose the proper lubricating measures according to operating conditions.

Sealing devices may be divided into non-contact and contact types according to their structure.

They should satisfy the following conditions :

- Free from excessive friction (heat generation)
- Easy maintenance (especially ease of mounting and dismounting)
- As low cost as possible

14-4-1 Non-contact type sealing devices

A non-contact type sealing device, which includes oil groove, flinger (slinger), and labyrinth, eliminates friction because it does not have a contact point with the shaft.

These devices utilize narrow clearance and centrifugal force and are especially suitable for operation at high rotation speed and high temperature.

Table 14-6 (1) Non-contact type sealing devices

(1) Oil groove

- This kind of seal having more than three grooves at the narrow clearance between the shaft and housing cover, is usually accompanied by other sealing devices except when it is used with grease lubrication at low rotation speed.
- Preventing entrance of contaminants can be improved by filling the groove with calcium grease (cup grease) having a consistency of 150 to 200.
- The clearance between the shaft and housing cover should be as narrow as possible. Recommended clearances are as follows.
 - Shaft diameter of less than 50mm 0.25 – 0.4mm
 - Shaft diameter of over 50mm 0.5 – 1 mm
- Recommended dimensions for the oil groove are as follows.
 - Width 2 – 5mm
 - Depth 4 – 5mm

Table 14-6 (2) Non-contact type sealing devices

(2) Flinger (slinger)	(3) Labyrinth									
 (d) Flinger attached inside  (e) Flinger attached outside  (f) Cover type flinger  (g) Oil thrower	 (h) Axial labyrinth  (i) Radial labyrinth  (j) Aligning labyrinth  (k) Axial labyrinth with greasing feature									
■ A flinger utilizes centrifugal force to splash away the oil and dirt. It produces an air stream which prevents oil leakage and dirt by a pumping action. In many cases, this device is used together with other sealing devices. ■ A flinger installed inside the housing (Fig. d) provides an inward pumping action, preventing lubricant leakage; and, when installed outside (Fig. e), the outward pumping action prevents lubricant contamination. ■ A cover type flinger (Fig. f) splashes away dirt and dust by centrifugal force. ■ The oil thrower, shown in (Fig. g), is a kind of flinger. An annular ridge on the shaft or a ring fitted onto the shaft utilizes centrifugal force to prevent the lubricant from flowing out.	■ A labyrinth provides clearance in the shape of engagements between the shaft and housing. It is the most suitable for prevention of lubricant leakage at high rotation speed. ■ Though an axial labyrinth, shown in (Fig. h), is popular because of its ease of mounting, the sealing effect is better in a radial labyrinth, shown in (Fig. i). ■ An aligning labyrinth (Fig. j) is used with self-aligning type bearings. ■ In the cases of (Fig. i) and (Fig. j), the housing or the housing cover should be split. ■ Recommended labyrinth clearances are given in the following table. <table><tr><th>Shaft diameter</th><th>Radial clearance</th><th>Axial clearance</th></tr><tr><td>50mm or less</td><td>0.25 – 0.4mm</td><td>1 – 2mm</td></tr><tr><td>Over 50mm</td><td>0.5 – 1 mm</td><td>3 – 5mm</td></tr></table> ■ To improve sealing effect, fill the labyrinth clearance with grease, shown in (Fig. k).	Shaft diameter	Radial clearance	Axial clearance	50mm or less	0.25 – 0.4mm	1 – 2mm	Over 50mm	0.5 – 1 mm	3 – 5mm
Shaft diameter	Radial clearance	Axial clearance								
50mm or less	0.25 – 0.4mm	1 – 2mm								
Over 50mm	0.5 – 1 mm	3 – 5mm								

14-4-2 Contact type sealing devices

This type provides a sealing effect by means of the contact of its end with the shaft and are manufactured from synthetic rubber, synthetic resin, or felt.

The synthetic rubber oil seal is most popular.

1) Oil seals

Many types and sizes of oil seals, as a finished part, have been standardized.

JTEKT produces various oil seals.

The names and functions of each oil seal part are shown in Fig. 14-8 and Table 14-7. Table 14-8 provides a representative example.

Fig. 14-8 Names of oil seal parts

Table 14-7 Complete list of oil seal part functions

Names	Functions
Sealing edge	Prevents fluid leakage by making contact with rotating shaft. (The contact surface of the sealing edge with the shaft should always be filled with lubricant, so as to maintain an oil film therein.)
Sealing lip and spring	Provides proper pressure on the sealing edge to maintain stable contact. Spring provides proper pressure on the lip and maintains such pressure for a long time.
Outside surface	Fixes the oil seal to the housing and prevents fluid leakage through the fitting surface. (Comes encased in metal cased type or rubber covered type.)
Case	Strengthens seal.
Minor lip (auxiliary lip)	Prevents entry of contaminants. (In many cases, the space between the sealing lip and minor lip is filled with grease.)

Table 14-8 Typical oil seal types

With case		With inner case	Without case
Without spring	With spring		With spring
HM (JIS GM) MH (JIS G)	HMS (JIS SM) MHS (JIS S) CRS	HMSH (JIS SA)	MS
HMA MHA	HMSA (JIS DM) MHSA (JIS D) CRSA	HMSAH (JIS DA)	—
• The oil seals shown in the lower row contain the minor lip (auxiliary lip). • Special types of seals such as the mud resistance seal, pressure resistance seal and outer seal for rotating housings can be provided to serve under various operating conditions.			• By providing a slit on the oil seals, it is possible to attach them from other points than the shaft ends.

Oil seals without minor lips are mounted in different directions according to their operating conditions (shown in Fig. 14-9).

Fig. 14-9 Direction of sealing lips and their purpose

When the seal is used in a dirty operating environment, or penetration of water is expected, it is advisable to have two oil seals combined or to have the space between the two sealing lips be filled with grease.

(shown in Fig. 14-10)

Fig. 14-10 Seals used in a dirty operating environment

Respective seal materials possess different properties. Accordingly, as shown in Table 14-9, allowable lip speed and operating temperature differ depending on the materials. Therefore, by selecting proper materials, oil seals can be used for sealing not only lubricants but also chemicals including alcohol, acids, alkali, etc.

Table 14-9 Allowable lip speed and operating temperature range of oil seals

Seal material	Allowable lip speed (m/s)	Operating temperature range (°C)
NBR	15	- 40 to + 120
Acrylic rubber	25	- 30 to + 150
Silicone rubber	32	- 50 to + 170
Fluoro rubber	32	- 20 to + 180

To ensure the maximum sealing effect of the oil seal, the shaft materials, surface roughness and hardness should be carefully chosen.

Table 14-10 shows the recommended shaft conditions.

Table 14-10 Recommended shaft conditions

Material	Machine structure steel, low alloy steel and stainless steel
Surface hardness	For low speed : harder than 30 HRC For high speed : harder than 50 HRC
Surface roughness	0.1 – 0.32μmRa and 0.8 – 2.5μmRz A surface which is excessively rough may cause oil leakage or abrasion ; whereas an excessively fine surface may cause sealing lip seizure, preventing the oil film from forming. Surface must also be free of spiral grinding marks (lead marks).

2) Felt seals and others

Although felt seals have been used conventionally, it is recommended to replace them with rubber oil seals because the use of felt seals are limited to the following conditions.

- Light dust protection
- Allowable lip speed : not higher than 5m/s

Contact type sealing devices include mechanical seals, O-rings and packings other than those described herein.

JTEKT manufactures various oil seals ranging from those illustrated in Table 14-8 to special seals for automobiles, large seals for rolling mills, mud resistance seals, pressure resistance seals, outer seals for rotating housings and O-rings. For details, refer to JTEKT separate catalog "Oil seals & O-rings" (CAT. NO. R2001E).

15. Handling of bearings

15-1 General instructions

Since rolling bearings are more precisely made than other machine parts, careful handling is absolutely necessary.

- 1) Keep bearings and the operating environment clean.
- 2) Handle carefully.

Bearings can be cracked and brinelled easily by strong impact if handled roughly.

- 3) Handle using the proper tools.

- 4) Keep bearings well protected from rust.

Do not handle bearings in high humidity.

Operators should wear gloves in order not to soil bearings with perspiration from their hands.

- 5) Bearings should be handled by experienced or well trained operators.
- 6) Set bearing operation standards and follow them.

- Storage of bearings
- Cleaning of bearings and their adjoining parts.
- Inspection of dimensions of adjoining parts and finish conditions
- Mounting
- Inspection after mounting
- Dismounting
- Maintenance and inspection (periodical inspection)
- Replenishment of lubricants

15-2 Storage of bearings

In shipping bearings, since they are covered with proper anti-corrosion oil and are wrapped in antitarnish paper, the quality of the bearings is guaranteed as long as the wrapping paper is not damaged.

If bearings are to be stored for a long time, it is advisable that the bearings be stored on shelves set higher than 30 cm from the floor, at a humidity less than 65 %, and at a temperature around 20°C.

Avoid storage in places exposed directly to the sun's rays or placing boxes of bearings against cold walls.

15-3 Bearing mounting

15-3-1 Recommended preparation prior to mounting

1) Preparation of bearings

Wait until just before mounting before removing the bearings from their packaging to prevent contamination and rust.

Since the anti-corrosion oil covering bearings is a highly capable lubricant, the oil should not be cleaned off if the bearings are pre-lubricated, or when the bearings are used for normal operation. However, if the bearings are used in measuring instruments or at high rotation speed, the anti-corrosion oil should be removed using a clean detergent oil. After removal of the anti-corrosion oil, bearings should not be left for a long time because they rust easily.

2) Inspection of shafts and housings

Clean up the shaft and housing to check whether it has flaws or burrs as a result of machining.

Be very careful to completely remove lapping agents (SiC, Al₂O₃, etc.), casting sands, and chips from inside the housing.

Next, check that the dimensions, forms, and finish conditions of the shaft and the housing are accurate to those specified on the drawing.

The shaft diameter and housing bore diameter should be measured at the several points as shown in Figs. 15-1 and 15-2.

Fig. 15-1 Measuring points on shaft diameter

Fig. 15-2 Measuring points on housing bore diameter

Furthermore, fillet radius of shaft and housing, and the squareness of shoulders should be checked.

When using shaft and housing which have passed inspection, it is advisable to apply machine oil to each fitting surface just before mounting.

15-3-2 Bearing mounting

Mounting procedures depend on the type and fitting conditions of bearings.

For general bearings in which the shaft rotates, an interference fit is applied to inner rings, while a clearance fit is applied to outer rings.

For bearings in which the outer rings rotate, an interference fit is applied to the outer rings.

Interference fitting is roughly classified as shown here. The detailed mounting processes are described in Tables 15-1 to 15-3.

Table 15-1 Press fit of bearings with cylindrical bores

Mounting methods	Descriptions
 (a) Using press fit (the most widely used method)	■ As shown in the Fig., a bearing should be mounted slowly with care, by using a mounting fixture to apply force evenly to the bearing. When mounting the inner ring, apply pressure to the inner ring only. Similarly, in mounting the outer ring, press only the outer ring.    (Inner ring press fit) (Outer ring press fit) (Inner ring press fit) ■ If interference is required on both the inner and outer ring of non-separable bearings, use two kinds of mounting fixture as shown in the Fig. and apply force care-fully, as rolling elements are easily damaged. Be sure never to use a hammer in such cases.  Simultaneous press fit of inner ring and outer ring
 (b) Using bolts and nuts (screw hole should be provided at the shaft end)	
 (c) Using hammers (only when there is no alternative measure)	

Reference Force is necessary to press fit or remove bearings.

The force necessary to press fit or remove inner rings of bearings differs depending on the finish of shafts and how much interference the bearings allow.

The standard values can be obtained by using the following equations.

(Solid shafts) $K_a = 9.8 f_k \cdot \Delta_{\text{deff}} \cdot B \left(1 - \frac{d^2}{D_i^2} \right) \times 10^3$ (15-1)

(Hollow shafts) $K_a = 9.8 f_k \cdot \Delta_{\text{deff}} \cdot B \frac{\left(1 - \frac{d^2}{D_i^2} \right) \left(1 - \frac{d_0^2}{d^2} \right)}{\left(1 - \frac{d_0^2}{D_i^2} \right)} \times 10^3$ (15-2)

In equations (15-1) and (15-2),

K_a : force necessary for press fit or removal	N
Δ_{deff} : effective interference	mm
f_k : resistance coefficient	
[Coefficient taking into consideration friction between shafts and inner rings ... refer to the table on the right]	
B : nominal inner ring width	mm
d : nominal inner ring bore diameter	mm
D_i : average outside diameter of inner ring	mm
d_0 : hollow shaft bore diameter	mm

Value of resistance coefficient f_k

Conditions	f_k
· Press fitting bearings on to cylindrical shafts	4
· Removing bearings from cylindrical shafts	6
· Press fitting bearings on to tapered shafts or tapered sleeves	5.5
· Removing bearings from tapered shafts or tapered sleeves	4.5
· Press fitting tapered sleeves between shafts and bearings	10
· Removing tapered sleeves from the space between shafts and bearings	11

Table 15-2 Shrink fit of cylindrical bore bearings

Shrink fit	Descriptions
 (a) Heating in an oil bath	■ This method, which expands bearings by heating them in oil, has the advantage of not applying too much force to bearings and taking only a short time. [Notes] ● Oil temperature should not be higher than 100 °C, because bearings heated at higher than 120 °C lose hardness. ● Heating temperature can be determined from the bore diameter of a bearing and the interference by referring to Fig. 15-3. ● Use nets or a lifting device to prevent the bearing from resting directly on the bottom of the oil container. ● Since bearings shrink in the radial direction as well as the axial direction while cooling down, fix the inner ring and shaft shoulder tightly with the shaft nut before shrinking, so that no space is left between them.  ■ Shrink fit proves to be clean and effective since, by this method, the ring can be provided with even heat in a short time using neither fire nor oil. (When electricity is being conducted, the bearing itself generates heat by its electrical resistance, aided by the built-in exciting coil.)
 (b) Induction heater	

Fig. 15-3 Heating temperature and expansion of inner rings

[Remarks]

1. Thick solid lines show the maximum interference value between bearings (class 0) and shafts (r 6, p 6, n 6, m 5, k 5, j 5) at normal temperature.
 2. Therefore, the heating temperature should be selected to gain a larger "expansion of the bore diameter" than the maximum interference values.
- (When fitting class 0 bearings having a 90 mm bore diameter to m 5 shafts, this figure shows that heating temperature should be 40 °C higher than room temperature to produce expansion larger than the maximum interference value of 48 μm.
- However, taking cooling during mounting into consideration, the temperature should be set 20 to 30 °C higher than the temperature initially required.

Table 15-3 Mounting bearings with tapered bores

Mounting methods	Descriptions
 ① Locknut	■ When mounting bearings directly on tapered shafts, provide oil holes and grooves on the shaft and inject high pressure oil into the space between the fitting surfaces (oil injection). Such oil injection can reduce tightening torque of locknut by lessening friction between the fitting surfaces. ■ When exact positioning is required in mounting a bearing on a shaft with no shoulder, use a clamp to help determine the position of the bearing.  Locating bearing by use of a clamp
 ② Hydraulic nut	
(a) Mounting on tapered shafts	
 ① Locknut	■ When mounting bearings on shafts, locknuts are generally used. Special spanners are used to tighten them. Bearings can also be mounted using hydraulic nuts.  special spanner
 ② Hydraulic nut	
(b) Mounting by use of an adapter sleeve	
 ① Locknut	■ When mounting tapered bore spherical roller bearings, the reduction in the radial internal clearance which gradually occurs during operation should be taken into consideration as well as the push-in depth described in Table 15-4. Clearance reduction can be measured by a thickness gage. First, stabilize the roller in the proper position and then insert the gage into the space between the rollers and the outer ring. Be careful that the clearance between both roller rows and the outer rings is roughly the same ($e \approx e'$). Since the clearance may differ at different measuring points, take measurements at several positions. ■ When mounting self-aligning ball bearings, leave enough clearance to allow easy aligning of the outer ring.
 ② Hydraulic nut	
(c) Mounting by use of a withdrawal sleeve	
 (d) Measuring clearances	

Table 15-4 Mounting tapered bore spherical roller bearings

Nominal bore diameter <i>d</i> mm		Reduction of radial internal clearance μm		Axial displacement, mm				Minimum required residual clearance, μm		
				1/12 taper		1/30 taper		C N clearance	C 3 clearance	C 4 clearance

560	630	260	350	3.9	4.8	9.75	12.0	200	300	410
630	710	300	390	4.3	5.3	10.8	13.3	210	320	460
710	800	340	430	4.8	6.0	12.0	15.0	230	370	530
800	900	370	500	5.3	6.7	13.3	16.8	270	410	570
900	1000	410	550	5.9	7.4	14.8	18.5	300	450	640

[Remark] The values for reduction of radial internal clearance listed above are values obtained when mounting bearings with CN clearance on solid shafts. In mounting bearings with C 3 clearance, the maximum value listed above should be taken as the standard.

15-4 Test run

A trial operation is conducted to insure that the bearings are properly mounted.

In the case of compact machines, rotation may be checked by manual operation at first.

If no abnormalities, such as those described below, are observed, then further trial operation proceeds using a power source.

- Knocking ...
due to flaws or entry of foreign matter on rolling contact surfaces.
- Excessive torque (heavy) ...
due to friction on sealing devices, too small clearances, and mounting errors.

- Uneven running torque ...
due to improper mounting and mounting errors.

For machines too large to allow manual operation, idle running is performed by turning off the power source immediately after turning it on. Before starting power operation, it must be confirmed that bearings rotate smoothly without any abnormal vibration and noise.

Power operation should be started under no load and at low speed, then the speed is gradually increased until the designed speed is reached.

During power operation, check the noise, increase in temperature and vibration.

If any of the abnormalities listed in Tables 15-5 and 15-6 are found, operation must be

stopped, and inspection for defects immediately conducted.

The bearings should be dismounted if necessary.

Table 15-5 Bearing noises, causes, and countermeasures

Noise types		Causes	Countermeasures
Cyclic	Flaw noise (similar to noise when punching a rivet)	Flaw on raceway	Improve mounting procedure, cleaning method and rust preventive method.
	Rust noise (Unclear siren-like noise)	Rust on raceway	Replace bearing.
Not cyclic	Brinelling noise (similar to a large hammering noise)	Brinelling on raceway	Replace bearing.
	Flaking noise (an irregular sandy noise.)	Entry of foreign matter	Improve cleaning method, sealing device. Use clean lubricant. Replace bearing.
Not cyclic	Fitting noise (drumming or hammering noise)	Improper fitting or excessive bearing clearance	Review fitting and clearance conditions. Provide preload. Improve mounting accuracy.
	Flaw noise, rust noise, flaking noise	Flaws, rust and flaking on rolling elements	Replace bearing.
Others	Squeak noise (often heard in cylindrical roller bearings with grease lubrication, especially in winter or at low temperatures)	If noise is caused by improper lubrication, a proper lubricant should be selected. In general, however, serious damage will not be caused by an improper lubricant if used continuously.	
	Abnormally large metallic sound	Abnormal load Incorrect mounting Insufficient amount of or improper lubricant	Review fitting, clearance. Adjust preload. Improve accuracy in processing and mounting shafts and housings. Improve sealing device. Refill lubricant. Select proper lubricant.

Table 15-6 Causes and countermeasures for abnormal temperature rise

Causes	Countermeasures
Too much lubricant	Reduce lubricant amount. Use grease of lower consistency.
Insufficient lubricant	Refill lubricant.
Improper lubricant	Select proper lubricant.
Abnormal load	Review fitting and clearance conditions and adjust preload.
Improper mounting (excessive friction)	Improve accuracy in processing and mounting shaft and housing. Review fitting. Improve sealing device.

Normally, listening rods are employed for bearing noise inspections.

The instrument detecting abnormalities through sound vibration and the Diagnosis System utilizing acoustic emission for abnormality detection are also applicable.

In general, bearing temperature can be estimated from housing temperature, but the most accurate method is to measure the temperature of outer rings directly via lubrication holes.

Normally, bearing temperature begins to rise gradually when operation is just starting; and, unless the bearing has some abnormality, the temperature stabilizes within one or two hours.

Therefore, a rapid rise in temperature or unusually high temperature indicates some abnormality.

15-5 Bearing dismounting

After dismounting bearings, handling of the bearings and the various methods available for this should be considered.

If the bearing is to be disposed of, any simple method such as torch cutting can be employed. If the bearing is to be reused or checked for the causes of its failure, the same amount of care as in mounting should be taken in dismounting so as not to damage the bearing and other parts.

Since bearings with interference fits are easily damaged during dismounting, measures to prevent damage during dismounting must be incorporated into the design.

It is recommended that dismounting devices be designed and manufactured, if necessary.

It is useful for discovering the causes of failures when the conditions of bearings, including mounting direction and location, are recorded prior to dismounting.

Dismounting method

Tables 15-7 to 15-9 describe dismounting methods for interference fit bearings intended for reuse or for failure analysis.

The force necessary to remove bearings can be calculated using the equations given on page A 142.

Table 15-7 Dismounting of cylindrical bore bearings

Inner ring dismounting methods	Descriptions
 (a) Dismounting by use of a press	• Non-separable bearings should be treated carefully during dismounting so as to minimize external force, which affects their rolling elements. • The easiest way to remove bearings is by using a press as shown in Fig. (a). It is recommended that the dismounting fixture be prepared so that the inner ring can receive the removal force. • Figs. (b) and (c) show a dismounting method in which special tools are employed. In both cases, the jaws of the tool should firmly hold the side of the inner ring. • Fig. (d) shows an example of removal by use of an induction heater: this method can be adapted to both mounting and dismounting of the inner rings of NU and NJ type cylindrical roller bearings. The heater can be used for heating and expanding inner rings in a short time.
 (b) Dismounting by use of special tools	
 (c) Dismounting by use of special tools	
 (d) Dismounting using induction heater	

Table 15-8 Dismounting tapered bore bearings

Inner ring dismounting methods	Descriptions
 (a) Dismounting by use of a wedge	• Fig. (a) shows the dismounting of an inner ring by means of driving wedges into notches at the back of the labyrinth. Fig. (b) shows dismounting by means of feeding high pressure oil to the fitting surfaces. In both cases, it is recommended that a stopper (ex. shaft nuts) be provided to prevent bearings from suddenly dropping out.
 (b) Dismounting by use of oil pressure	
 (c) Dismounting by use of clamps	• For bearings with an adapter sleeve, the following two methods are suitable. As shown in Fig. (c), fix bearings with clamps, loosen locknuts, then hammer off the adapter sleeve. This method is mainly used for small size bearings. Fig. (d) shows the method using hydraulic nuts.
 (d) Dismounting by use of hydraulic nuts	
 (e) Dismounting by use of locknuts	• Small size bearings with withdrawal sleeves can be removed by tightening locknuts as shown in Fig. (e). For large size bearings, provide several bolt holes on locknuts as shown in Fig. (f), and tighten bolts. The bearings can then be removed as easily as small size bearings.
 (f) Dismounting by use of bolts	
 (g) Dismounting by use of hydraulic nuts	• Fig. (g) shows the method using hydraulic nuts.

Table 15-9 Dismounting of outer rings

Outer ring dismounting methods	Description
 (a) Notches for dismounting	• To dismount outer rings with interference fits, it is recommended that notches or bolt holes be provided on the shoulder of the housings.
 (b) Bolt holes and bolts for dismounting	

15-6 Maintenance and inspection of bearings

Periodic and thorough maintenance and inspection are indispensable to drawing full performance from bearings and lengthening their useful life.

Besides, prevention of accidents and down time by early detection of failures through maintenance and inspection greatly contributes to the enhancement of productivity and profitability.

15-6-1 Cleaning

Before dismounting a bearing for inspection, record the physical condition of the bearing, including taking photographs.

Cleaning should be done after checking the amount of remaining lubricant and collecting lubricant as a sample for examination.

- A dirty bearing should be cleaned using two cleaning processes, such as rough cleaning and finish cleaning.
It is recommended that a net be set on the bottom of cleaning containers.
- In rough cleaning, use brushes to remove grease and dirt. Bearings should be handled carefully. Note that raceway surfaces may be damaged by foreign matter, if bearings are rotated in cleaning oil.
- During finish cleaning, clean bearings carefully by rotating them slowly in cleaning oil.

In general, neutral water-free light oil or kerosene is used to clean bearings, a warm alkali solution can also be used if necessary. In any case, it is essential to keep oil clean by filtering it prior to cleaning.

Apply anti-corrosion oil or rust preventive grease on bearings immediately after cleaning.

15-6-2 Inspection and analysis

Before determining that dismounted bearings will be reused, the accuracy of their dimensions and running, internal clearance, fitting surfaces, raceways, rolling contact surfaces, cages and seals must be carefully examined, so as to confirm that no abnormality is present.

It is desirable for skilled persons who have sufficient knowledge of bearings to make decisions on the reuse of bearings.

Criteria for reuse differs according to the performance and importance of machines and inspection frequency.

If the following defects are found, replace the bearing with a new one.

- Cracks and chips in bearing components
- Flaking on the raceway surfaces and the rolling contact surfaces
- Other failures of a serious degree described in the following section "16. Examples of bearing failures."

15-7 Methods of analyzing bearing failures

It is important for enhancing productivity and profitability, as well as for accident prevention that abnormalities in bearings are detected during operation.

Representative detection methods are described in the following section.

1) Noise checking

Since the detection of abnormalities in bearings from noises requires ample experience, sufficient training must be given to inspectors. Given this, it is recommended that specific persons be assigned to this work in order to gain this experience.

Attaching hearing aids or listening rods on housings is effective for detecting bearing noise.

2) Checking of operating temperature

Since this method utilizes change in operating temperature, its application is limited to relatively stable operations.

For detection, operating temperatures must be continuously recorded.

If abnormalities occur in bearings, operating temperature not only increase but also change irregularly.

It is recommended that this method be employed together with noise checking.

3) Lubricant checking

This method detects abnormalities from the foreign matter, including dirt and metallic powder, in lubricants collected as samples.

This method is recommended for inspection of bearings which cannot be checked by close visual inspection, and large size bearings.

16. Examples of bearing failures

Table 16-1 (1) Bearing failures, causes and countermeasures

Failures	Characteristics		Damages	Causes	Countermeasures
① Flaking	 (A-6961)  (A-6476) Flaking is a phenomenon when material is removed in flakes from a surface layer of the bearing raceways or rolling elements due to rolling fatigue. This phenomenon is generally attributed to the approaching end of bearing service life. However, if flaking occurs at early stages of bearing service life, it is necessary to determine causes and adopt countermeasures. [Reference] Pitting Pitting is another type of failure caused by rolling fatigue, in which minute holes of approx. 0.1 mm in depth are generated on the raceway surface.		Flaking occurring at an incipient stage	- Too small internal clearance - Improper or insufficient lubricant - Too much load - Rust	- Provide proper internal clearance. - Select proper lubricating method or lubricant.
			Flaking on one side of radial bearing raceway	Extraordinarily large axial load	Fitting between outer ring on the free side and housing should be changed to clearance fit.
			Symmetrical flaking along circumference of raceway	Inaccurate housing roundness	Correct processing accuracy of housing bore. (Especially for split housings, care should be taken to ensure processing accuracy.)
			Slanted flaking on the radial ball bearing raceway	- Improper mounting - Shaft deflection - Inaccuracy of the shaft and housing	- Correct centering. - Widen bearing internal clearance. - Correct squareness of shaft or housing shoulder.
			Flaking occurring near the edge of the raceway or rolling contact surface of roller bearings		
② Cracking, chipping	 (A-6395)		Cracking in outer ring or inner ring	- Excessive interference - Excessive fillet on shaft or housing - Heavy impact load - Advanced flaking or seizure	- Select proper fit. - Adjust fillet on the shaft or in the housing to smaller than that of the bearing chamfer dimension. - Re-examine load conditions.
			Cracking on rolling elements	- Heavy impact load - Advanced flaking	- Improve mounting and handling procedure. - Re-examine load conditions.
			Cracking on the rib	- Impact on rib during mounting - Excessive axial impact load	- Improve mounting procedure. - Re-examine load conditions.
③ Brinelling, nicks	 (A-6617) (Brinelling) Brinelling is a small surface indentation generated either on the raceway through plastic deformation at the contact point between the raceway and rolling elements, or on the rolling surfaces from entry of foreign matter, when heavy load is applied while the bearing is stationary or rotating at a low rotation speed. Nicks are those indentations produced directly by rough handling such as hammering.		Brinelling on the raceway or rolling contact surface	Entry of foreign matter	- Clean bearing and its peripheral parts. - Improve sealing devices.
			Brinelling on the raceway surface at the same interval as the rolling element spacing	- Impact load during mounting - Excessive load applied while bearing is stationary	- Improve mounting procedure. - Improve machine handling.
			Nicks on the raceway or rolling contact surface	Careless handling	Improve mounting and handling procedure.

Table 16-1 (2) Bearing failures, causes and countermeasures

Failures	Characteristics		Damages	Causes	Countermeasures
[4] Pear skin, discoloration	 (A-6720) (Discoloration) • Pear skin is a phenomenon in which minute brinell marks cover the entire rolling surface, caused by the entry of foreign matter. This is characterized by loss of luster and a rolling surface that is rough in appearance. • In extreme cases, this is accompanied by discoloration due to heat generation. • Discoloration is a phenomenon in which the surface color changes because of staining or heat generation during rotation. • Color change caused by rust and corrosion is generally separate from this phenomenon.		Indentation similar to pear skin on the raceway and rolling contact surface.	• Entry of minute foreign matter	• Clean the bearing and its peripheral parts. • Improve sealing device.
			Discoloration of the raceway, surface rolling contact surface, rib face, and cage riding land.	• Too small bearing internal clearance • Improper or insufficient lubricant • Quality deterioration of lubricant due to aging, etc.	• Provide proper internal clearance. • Select proper lubricating method or lubricant.
[5] Scratches, scuffing	 (A-6459) (Scuffing) • Scratches are relatively shallow marks generated by sliding contact, in the same direction as the sliding. This is not accompanied by apparent melting of material. • Scuffing refers to marks, the surface of which are partially melted due to higher contact pressure and therefore a greater heat effect. • Generally, scuffing may be regarded as a serious case of scratches.		Scratches on raceway or rolling contact surface	• Insufficient lubricant at initial operation • Careless handling	• Apply lubricant to the raceway and rolling contact surface when mounting. • Improve mounting procedure.
			Scuffing on rib face and roller end face	• Improper or insufficient lubricant • Improper mounting • Excessive axial load	• Select proper lubricating method or lubricant. • Correct centering of axial direction.
[6] Smearing	 (A-6640) Smearing is a phenomenon in which a cluster of minute seizures cover the rolling contact surface. Since smearing is caused by high temperature due to friction, the surface of the material usually melts partially; and, the smeared surfaces appear very rough in many cases.		Smearing on raceway or rolling contact surface	• Improper or insufficient lubricant • Slipping of the rolling elements This occurs due to the break down of lubricant film when an abnormal self rotation causes slip of the rolling elements on the raceway.	• Select proper lubricating method or lubricant. • Provide proper preload.
[7] Rust, corrosion	 (A-7130) • Rust is a film of oxides, or hydroxides, or carbonates formed on a metal surface due to chemical reaction. • Corrosion is a phenomenon in which a metal surface is eroded by acid or alkali solutions through chemical reaction (electrochemical reaction such as chemical combination and battery formation); resulting in oxidation or dissolution. It often occurs when sulfur or chloride contained in the lubricant additives is dissolved at high temperature.		Rust partially or completely covering the bearing surface.	• Improper storage condition • Dew formation in atmosphere	• Improve bearing storage conditions. • Improve sealing devices. • Provide rust preventive treatment before long cessation of operation.
			Rust and corrosion at the same interval as rolling element spacing	• Contamination by water or corrosive matter	• Improve sealing devices.
[8] Electric pitting	 (A-6652) When an electric current passes through a bearing while in operation, it can generate sparks between the raceway and rolling elements through a very thin oil film, resulting in melting of the surface metal in this area. This phenomenon appears to be pitting at first sight. (The resultant flaw is referred to as a pit.) When the pit is magnified, it appears as a hole like a crater, indicating that the material melted when it was sparking. In some cases, the rolling surface becomes corrugated by pitting.		Pitting or a corrugated surface failure on raceway and rolling contact surface	• Sparks generated when electric current passes through bearings The bearings must be replaced, if the corrugated texture is found by scratching the surface with a fingernail or if pitting can be observed by visual inspection.	• Providing a bypass which prevents current from passing through bearings. • Insulation of bearings.

Table 16-1 (3) Bearing failures, causes and countermeasures

Failures	Characteristics		Damages	Causes	Countermeasures
9 Wear	 (A-4719) Normally, wear of bearing is observed on sliding contact surfaces such as roller end faces and rib faces, cage pockets, the guide surface of cages and cage riding lands. Wear is not directly related to material fatigue. Wear caused by foreign matter and corrosion can affect not only sliding surfaces but rolling surfaces.		Wear on the contact surfaces (roller end faces, rib faces, cage pockets)	Improper or insufficient lubricant	· Select proper lubricating method or lubricant. · Improve sealing device. · Clean the bearing and its peripheral parts.
			Wear on raceways and rolling contact surfaces	· Entry of foreign matter · Improper or insufficient lubricant	
10 Fretting	 (A-6649) Fretting occurs to bearings which are subject to vibration while in stationary condition or which are exposed to minute vibration. It is characterized by rust-colored wear particles. Since fretting on the raceways often appears similar to brinelling, it is sometimes called "falsebrinelling".		Rust-colored wear particles generated on the fitting surface (fretting corrosion)	· Insufficient interference	· Provide greater interference · Apply lubricant to the fitting surface
			Brinelling on the raceway surface at the same interval as rolling element spacing (false brinelling)	· Vibration and oscillation when bearings are stationary.	· Improve fixing method of the shaft and housing. · Provide preload to bearing.
11 Creep	 (A-6647) Creeping is a phenomenon in which bearing rings move relative to the shaft or housing during operation.		Wear, discoloration and scuffing, caused by slipping on the fitting surfaces	· Insufficient interference · Insufficient tightening of sleeve	· Provide greater interference. · Proper tightening of sleeve.
12 Damage to cages	 (A-6455) Since cages are made of low hardness materials, external pressure and contact with other parts can easily produce flaws and distortion. In some cases, these are aggravated and become chipping and cracks. Large chipping and cracks are often accompanied by deformation, which may reduce the accuracy of the cage itself and may hinder the smooth movement of rolling elements.		Flaws, distortion, chipping, cracking and excessive wear in cages. Loose or damaged rivets.	· Extraordinary vibration, impact, moment · Improper or insufficient lubricant · Improper mounting (misalignment) · Dents made during mounting	· Re-examine load conditions. · Select proper lubricating method or lubricant. · Minimize mounting deviation. · Re-examine cage types. · Improve mounting.
13 Seizure	 (A-6679) A phenomenon caused by abnormal heating in bearings.		Discoloration, distortion and melting together	· Too small internal clearance · Improper or insufficient lubricant · Excessive load · Aggravated by other bearing flaws	· Provide proper internal clearance. · Select proper lubricating method or lubricant. · Re-examine bearing type. · Earlier discovery of bearing flaws.

Deep groove ball bearings

Deep groove ball bearings are available in a variety of sizes, and are the most popular of all rolling bearings. This type of bearing supports radial load and a certain degree of axial load in both directions simultaneously.

■ Shielded / sealed type

- Simplifies sealing structure of applications.
- Greasing is not necessary because bearings are pre-lubricated.
- Table 1 on the next page lists major shielded and sealed bearing types and compares their performance.

■ With locating snap ring

- Bearings with a locating snap ring can be fit to the housing easily, as the locating snap ring facilitates axial positioning.

■ Extra-small ball bearings and miniature ball bearings

- The open type is widely used. Also available are the shielded/sealed type and the flanged type; the latter is easily positioned in the axial direction.

Single-row deep groove ball bearings

Open type

Bore diameter **10 – 500 mm**

Shielded/sealed type

Bore diameter **10 – 220 mm**

With snap ring groove With locating snap ring

Bore diameter **10 – 130 mm**

Extra-small ball bearings and miniature ball bearings

Bore diameter **1 – 9 mm**

Flanged type

Bore diameter **1 – 9 mm**

Double-row deep groove ball bearings

(with filling slot)

Bore diameter **10 – 75 mm**

Table 1 Comparison of shielded and sealed bearing performance

Type	Shielded		Sealed		
	Non-contact type	Non-contact type	Contact type		Extremely light contact type
	ZZ type	2RU type	2RS type	2RK type	2RD type
	 (a) ¹⁾ (b)	 (c)	 (d) ²⁾ (e)	 (f)	 (g)
Characteristics					
Friction torque	Small	Small	Large	Large	Small
High speed performance	Good	Good	Limited because of contact		Good
Grease sealing property	Good	Better than ZZ type	Better than 2RU type for low-speed applications	Excellent	Excellent
Dirt resistance	Good	Better than ZZ type	Better than 2RU type	Excellent	Excellent
Water resistance	Economical	Better than ZZ type but inferior to 2RS, 2RK and 2RD types	Good	Excellent	Better than ZZ and 2RU types
Operating temperature ³⁾	- 30 to +110°C		- 30 to +100°C		- 30 to +110°C

[Notes] 1) Illustration (a) of the ZZ type shows the relatively small size bearing.
 2) Illustration (d) of the 2RS type shows the relatively small size bearing.
 3) The operating temperature range listed is for the standard type. It can be widened by using a different type of grease or sealing material. Consult with JTEKT for details.

■ Handling instructions

- 1) The shielded/sealed type deep groove ball bearing and the deep groove ball bearing with a locating snap ring are designed for use with the inner ring rotating. Consult with JTEKT on use with the outer ring rotating.
- 2) When the axial load is large, make the shaft shoulder and housing shoulder larger than usual. (Referring to the specification table, make the mounting dimension d_a larger and make D_a smaller.)

Boundary dimensions	The dimensions of standard series are as specified in JIS B 1512. For extra-small and miniature ball bearings, special series (ML) are specified together with those described above.																																																																								
Tolerances	As specified in JIS B 1514-1. (refer to Table 7-3 on pp. A 60 – A 63.)																																																																								
Radial internal clearance	■ Deep groove ball bearings (except extra-small ball bearings and miniature ball bearings) as specified in JIS B 1520 (refer to Table 10-2 on p. A 102.) ■ Extra-small ball bearings and miniature ball bearings (refer to Table 10-3 on p. A 102.) ■ Deep groove ball bearings for motors (refer to Table 10-6 on p. A 105.)																																																																								
Recommended fits	■ Bearings of classes 0 and 6 (refer to Table 9-4 on pp. A 91, 92.) ■ Precision extra-small ball bearings and miniature ball bearings (refer to Table 9-5 on p. A 93.)																																																																								
Standard cages	• Synthetic resin molded cage (supplementary code : FG, MG) • Pressed cage (supplementary code : //) • Copper alloy machined cage (supplementary code : FY) [Remark] For certain applications, stainless steel sheet pressed cages (YS) may also be used.	<table><tr><th colspan="4">Application of standard cages</th></tr><tr><th>Bearing series</th><th>Molded cage</th><th>Pressed cage</th><th>Machined cage</th></tr><tr><td>68</td><td>683 – 689</td><td>–</td><td>–</td></tr><tr><td>69</td><td>693 – 699</td><td>–</td><td>–</td></tr><tr><td>60</td><td>603 – 609</td><td>–</td><td>–</td></tr><tr><td>62</td><td>623 – 629</td><td>–</td><td>–</td></tr><tr><td>63</td><td>633 – 639</td><td>–</td><td>–</td></tr><tr><td>67</td><td>–</td><td>6700 – 6706</td><td>–</td></tr><tr><td>68</td><td>–</td><td>6800 – 6838</td><td>6840 – 68/600</td></tr><tr><td>69</td><td>–</td><td>6900 – 6918</td><td>6920 – 6980</td></tr><tr><td>160</td><td>–</td><td>16001 – 16028</td><td>16030 – 16072</td></tr><tr><td>60</td><td>6000 – 6009</td><td>6010 – 6034</td><td>6036 – 6084</td></tr><tr><td>62</td><td>6200 – 6208, 6210</td><td>6209, 6211 – 6230</td><td>6232 – 6248</td></tr><tr><td>63</td><td>6300 – 6309</td><td>6310 – 6328</td><td>6330 – 6340</td></tr><tr><td>64</td><td>–</td><td>6403 – 6418</td><td>–</td></tr><tr><td>42</td><td>–</td><td>4200 – 4215</td><td>–</td></tr><tr><td>43</td><td>–</td><td>4302 – 4315</td><td>–</td></tr></table>				Application of standard cages				Bearing series	Molded cage	Pressed cage	Machined cage	68	683 – 689	–	–	69	693 – 699	–	–	60	603 – 609	–	–	62	623 – 629	–	–	63	633 – 639	–	–	67	–	6700 – 6706	–	68	–	6800 – 6838	6840 – 68/600	69	–	6900 – 6918	6920 – 6980	160	–	16001 – 16028	16030 – 16072	60	6000 – 6009	6010 – 6034	6036 – 6084	62	6200 – 6208, 6210	6209, 6211 – 6230	6232 – 6248	63	6300 – 6309	6310 – 6328	6330 – 6340	64	–	6403 – 6418	–	42	–	4200 – 4215	–	43	–	4302 – 4315	–

Angular contact ball bearings

Angular contact ball bearings are suitable for applications which require high accuracy and good high-speed performance. This type of bearing is designed to carry a combined load.

- Single-row angular contact ball bearings and matched pair angular contact ball bearings

- The standard contact angles are 15°, 30° and 40°.

They are identified, respectively, by the supplementary codes "C", "A" (omitted) and "B". Bearings with a smaller contact angle are more suitable for applications involving high-speed rotation. Those with a larger contact angle feature superior axial load resistance.

- Angular contact ball bearings are often preloaded to enhance their rigidity and rotating performance.

(refer to p. A 112.)

For high-precision matched pair angular contact ball bearings of class 5 or higher, which are used in machine tools and other precision equipment, the standard preload is specified in four levels: slight (S), light (L), medium (M) and heavy (H).

(refer to Table 11-2 on p. A 114.)

- When this type of bearing is loaded radially, an axial component of force is produced. In this case, two bearings are used together facing one another, or two or more bearings are matched and used.
- Tables 1 and 2 list the different types of single-row and matched pair/stack angular contact ball bearings and describe their characteristics.

(refer to p. A 38.)

- Double-row angular contact ball bearings

Consist of two single-row angular contact ball bearings matched back-to-back, with inner and outer rings integrated.

Table 3 shows major types and their characteristics.

- Four-point contact ball bearings

- Have a contact angle of 35° and an inner ring divided into two annular pieces. They are suitable for applications that involve either axial loading or combined loading, where the axial load makes up the major part of the load.
- Able to support both axial load and a certain degree of radial load. Each rolling element is in contact with each of the inner and outer rings at a single point, and both contact points lie on the contact angle line. The line runs to either the right or left depending on the direction of the axial load.

Single-row angular contact ball bearings

Bore diameter 10 – 380 mm

Matched pair angular contact ball bearings

Bore diameter 10 – 380 mm

Double-row angular contact ball bearings

Bore diameter 10 – 110 mm

Four-point contact ball bearings

Bore diameter 20 – 110 mm

- Consult with JTEKT when using the four-point contact ball bearing because application conditions such as load magnitude should be examined carefully.

Table 1 Single-row angular contact ball bearings

Standard type	- Single-row angular contact ball bearings accommodate radial load and axial load in one direction. - Bearings with a machined cage are suitable for high-speed applications.
	
(with pressed cage)	
	
(with machined cage)	

Reference G-type bearing

"G-type" bearings have a stand-out between the inner ring and outer ring on both sides that are equal in size. This arrangement is called "flush ground processing." These bearings can be matched in a variety of ways.

Table 2 Matched pair and stack angular contact ball bearings

Back-to-back arrangement (DB)		- Carries radial load and axial load in both directions. - Suitable for applications involving moment loading because the distance between the load centers (α) is long. - As for the preloaded type, the clearance is pre-adjusted so that bearings will be preloaded the proper amount when the inner ring is fixed with a nut.
Face-to-face arrangement (DF)		- Carries radial load and axial load in both directions. - Has a smaller moment load accommodating capacity than the back-to-back arrangement, because the distance between the load centers (α) is shorter. - As for the preloaded type, the clearance is pre-adjusted so that bearings will be preloaded the proper amount when the outer rings are pressed together.
Tandem arrangement (DT)		- Carries radial load and axial load in one direction. - Suitable for applications which involve a high degree of axial loading.

Table 3 Double-row angular contact ball bearings

		- Accommodates radial load and axial load in both directions. Also able to accommodate moment load. When installing bearings with filling slot (32 and 33 series), the raceway side without filling slot must accommodate main load. - The 32 and 33 series are provided with a filling slot, while the 52 and 53 series are not. 32 and 33 series : contact angle 32° 52 and 53 series : contact angle 24° - Inferior to single-row and matched pair angular contact ball bearings in terms of high-speed and high accuracy performance. - Shielded or sealed 52 and 53 series bearings are also available.
(with filling slot) 32, 33	(without filling slot) 52, 53	
		
Shielded 52...ZZ, 53...ZZ	Sealed 52...2RS, 53...2RS	

Boundary dimensions	The dimensions of standard series are as specified in JIS B 1512.																																														
Tolerances	· As specified in JIS B 1514-1. (refer to Table 7-3 on pp. A 60 – A 63.)																																														
	· JTEKT has established "special tolerances" for bore diameter and outside diameter, as listed in the table to the right, to make it easy to produce high-precision matched stack bearings. Bearings which are produced based on these tolerances are identified by the supplementary code "K5."																																														
	<table><tr><th colspan="6">Special tolerances (K5) Unit : μm</th></tr><tr><th colspan="2">Nominal bore diameter d (mm)</th><th colspan="4">Single plane mean bore diameter (Δd_{mp}) or single plane mean outside diameter deviation (ΔD_{mp})</th></tr><tr><th colspan="2"></th><th colspan="2">class 5</th><th colspan="2">class 4</th></tr><tr><th>over</th><th>up to</th><th>upper</th><th>lower</th><th>upper</th><th>lower</th></tr><tr><td>–</td><td>50</td><td>– 1</td><td>– 4</td><td>– 1</td><td>– 3</td></tr><tr><td>50</td><td>80</td><td>– 1</td><td>– 5</td><td>– 1</td><td>– 4</td></tr><tr><td>80</td><td>120</td><td>– 1</td><td>– 5</td><td>– 1</td><td>– 4</td></tr></table>						Special tolerances (K5) Unit : μm						Nominal bore diameter d (mm)		Single plane mean bore diameter (Δd_{mp}) or single plane mean outside diameter deviation (ΔD_{mp})						class 5		class 4		over	up to	upper	lower	upper	lower	–	50	– 1	– 4	– 1	– 3	50	80	– 1	– 5	– 1	– 4	80	120	– 1	– 5	– 1

■ Refer to Table 11-3 on page A 115 for the recommended fits of high-precision matched pair bearings (class 5 and class 4), which are used with light preload (L) or middle preload (M).																																															

Standard cages	● Pressed cage (supplementary code : //) ● Copper alloy machined cage (supplementary code : FY) [Note] Machine tools are generally equipped with bearings that have a phenolic resin machined cage (FT). Bearings with a polyamide molded cage can also be used depending on the applications. Four-point contact ball bearings usually use a copper alloy machined cage. 		Static equivalent radial load												
$P_{0r} = X_0 F_r + Y_0 F_a$														
In reference to single-row and tandem arrangement bearings,														
when $P_{0r} < F_r$,														
$P_{0r} = F_r$														

[Note]
When two single-row angular contact ball bearings are used facing one another, an axial component of force is produced under radial load. In this case, refer to page A 38 for calculation of the dynamic equivalent radial load.

Equivalent radial load Double-row angular contact ball bearings	Dynamic equivalent radial load							
	$P_r = XF_r + YF_a$							
	Static equivalent radial load							
	$P_{0r} = X_0F_r + Y_0F_a$							

Contact angle	e	$F_a/F_r \leq e$		$F_a/F_r > e$		(reference)
		X	Y	X	Y	
24°	0.66	1	0.95	0.68	1.45	52, 53 series
32°	0.86	1	0.73	0.62	1.17	32, 33 series

Contact angle	X_0	Y_0	(reference)
24°	1	0.78	52, 53 series
32°	1	0.63	32, 33 series

[Note] In angular contact ball bearings, slippage occurs between the balls and raceways under too small a load, causing smearing to develop. Matched pair bearings may develop smearing when the ratio of the axial load to the radial load exceeds the value of e ($F_a / F_r > e$), as listed in the specification table. Consult with JTEKT when these bearings are used under the above conditions.

[Reference] Relationship between axial load and axial displacement

[Notes] 1) Limiting speeds shown above are applicable to machined cage bearings.
Limiting speeds of pressed cage bearings should be kept to under 80% of this value.
For bearings with 15° contact angle, this figure is applied to the high precision bearings ranked higher than class 5, used with machined cage or molded cage.

2) B, C or no indication after the bearing number indicates nominal contact angle of 40°, 15° and 30° respectively.

[Remark] Standard cage types used for the above bearings are described earlier in this section.

[Notes] 1) Limiting speeds shown above are applicable to machined cage bearings.
Limiting speeds of pressed cage bearings should be kept to under 80% of this value.
For bearings with 15° contact angle, this figure is applied to the high precision bearings ranked higher than class 5, used with machined cage or molded cage.

2) B, C or no indication after the bearing number indicates nominal contact angle of 40°, 15° and 30° respectively.
[Remark] Standard cage types used for the above bearings are described earlier in this section.

[Notes] 1) Limiting speeds shown above are applicable to machined cage bearings.
Limiting speeds of pressed cage bearings should be kept to under 80% of this value.
For bearings with 15° contact angle, this figure is applied to the high precision bearings ranked higher than class 5, used with machined cage or molded cage.

2) B, C or no indication after the bearing number indicates nominal contact angle of 40°, 15° and 30° respectively.

[Remark] Standard cage types used for the above bearings are described earlier in this section.

[Notes] 1) Limiting speeds shown above are applicable to machined cage bearings.

Limiting speeds of pressed cage bearings should be kept to under 80% of this value.

For bearings with 15° contact angle, this figure is applied to the high precision bearings ranked higher than class 5, used with machined cage or molded cage.

2) B, C or no indication after the bearing number indicates nominal contact angle of 40°, 15° and 30° respectively.

[Remark] Standard cage types used for the above bearings are described earlier in this section.

[Notes] 1) Limiting speeds shown above are applicable to machined cage bearings.
Limiting speeds of pressed cage bearings should be kept to under 80% of this value.
For bearings with 15° contact angle, this figure is applied to the high precision bearings ranked higher than class 5, used with machined cage or molded cage.

2) B or no indication after the bearing number indicates nominal contact angle of 15° and 30° respectively.

[Remark] Standard cage types used for the above bearings are described earlier in this section.

[Notes] 1) Limiting speeds shown above are applicable to machined cage bearings. Limiting speeds of pressed cage bearings should be kept to under 80% of this value. For bearings with 15° contact angle, this figure is applied to the high precision bearings ranked higher than class 5, used with machined cages or molded cages.

2) B, C or no indication after the bearing number indicates nominal contact angle of 40°, 15° and 30° respectively. [Remark] Standard cage types used for the above bearings are described earlier in this section.

[Notes] 1) Limiting speeds shown above are applicable to machined cage bearings.
Limiting speeds of pressed cage bearings should be kept to under 80% of this value.
For bearings with 15° contact angle, this figure is applied to the high precision bearings ranked higher than class 5, used with machined cages or molded cages.

2) B, C or no indication after the bearing number indicates nominal contact angle of 40°, 15° and 30° respectively.

[Notes] 1) Limiting speeds shown above are applicable to machined cage bearings. Limiting speeds of pressed cage bearings should be kept to under 80% of this value. For bearings with 15° contact angle, this figure is applied to the high precision bearings ranked higher than class 5, used with machined cages or molded cages.

2) B, C or no indication after the bearing number indicates nominal contact angle of 40°, 15° and 30° respectively. [Remark] Standard cage types used for the above bearings are described earlier in this section.

[Notes] 1) Limiting speeds shown above are applicable to machined cage bearings.
Limiting speeds of pressed cage bearings should be kept to under 80% of this value.
For bearings with 15° contact angle, this figure is applied to the high precision bearings ranked higher than class 5, used with machined cages or molded cages.

2) B, C or no indication after the bearing number indicates nominal contact angle of 40°, 15° and 30° respectively.
[Remark] Standard cage types used for the above bearings are described earlier in this section.

[Notes] 1) Limiting speeds shown above are applicable to machined cage bearings.
Limiting speeds of pressed cage bearings should be kept to under 80% of this value.
For bearings with 15° contact angle, this figure is applied to the high precision bearings ranked higher than class 5, used with machined cages or molded cages.

2) B, C or no indication after the bearing number indicates nominal contact angle of 40°, 15° and 30° respectively.
[Remark] Standard cage types used for the above bearings are described earlier in this section.

[Note] 1) The maximum value of d_a is applied to shielded and sealed type bearings.

[Remark] Standard cage types used for the above bearings are described earlier in this section.

Self-aligning ball bearings

Self-aligning ball bearings have a spherical outer ring raceway, the center of whose curvature meets that of the bearing itself, so that the inner ring, balls and cage continue to rotate, aligning themselves if they have become misaligned within design limits.

This type of bearing is suitable when the displacement of the centers around which the shaft and housing rotate and shaft deflection are likely to occur.

Bearings with a tapered bore can easily be fit to the shaft with an adapter assembly.

θ: Allowable aligning angle

Self-aligning ball bearings

Cylindrical bore

Tapered bore

Bore diameter **10 – 90 mm**

Sealed type

Bore diameter **10 – 55 mm**

Extended inner ring type

Bore diameter **20 – 60 mm**

Adapter assemblies

Bore diameter **17 – 80 mm**

Boundary dimensions	The dimensions of standard series are as specified in JIS B 1512.
Tolerances	As specified in JIS B 1514-1, class 0. (refer to Table 7-3 on pp. A 60 – A 63.)
Radial internal clearance	As specified in JIS B 1520. (refer to Table 10-6 on p. A 105.)
Recommended fits	Refer to Table 9-4 on pp. A 91, 92.
Standard cages	• Staggered type pressed steel cage (application : all dimensional range of 12, 13, 112, 113, 22...2RS and 23...2RS series) • Snap type pressed steel cage (application : all dimensional range of 22 series and those of No. 2300 thru 2316.)
Allowable aligning angle	• 12 and 22 series.....0.044 rad (2.5°) • 13 and 23 series.....0.052 rad (3°) • 22...2RS and 23...2RS series.....0.026 rad (1.5°)

Dynamic equivalent radial load

$$P_r = XF_r + YF_a$$

$F_a/F_r \leq e$		$F_a/F_r > e$	
X	Y	X	Y
1	Y_1	0.65	Y_2

Static equivalent radial load

$$P_{0r} = F_r + Y_0 F_a$$

Refer to the bearing specification table for values of e , Y_1 , Y_2 and Y_0 .

Cylindrical roller bearings

Cylindrical roller bearings feature high radial load capacity because the rollers and raceway are in linear contact. These bearings are suitable for applications that involve heavy radial and impact loading.

They are also appropriate for high-speed applications in that they can be machined very accurately due to their structure.

Having a separable inner ring or outer ring, these bearings can be mounted and dismantled easily.

Single-row cylindrical roller bearings

- The NU and N types exhibit their best performance when used as free side bearings since they adjust to the shaft's axial movement, to a certain extent, relative to the housing position.
- The NJ and NF types carry axial load in one direction, while the NUP and NH types can carry a certain degree of axial load in both directions.
- Type R cylindrical roller bearings feature enhanced load rating compared with standard series, though both have equal dimensions. This is because type R bearings have different internal design. They are identified by supplementary code "R".

Double-row cylindrical roller bearings

- Double-row cylindrical roller bearings come in two types : with a cylindrical bore, and with a tapered bore. As for those with a tapered bore, the specified amount of clearance can be obtained by adjusting the press-in distance. Some bearings have lubrication holes and lubrication grooves on the outer ring. They are identified by supplementary code "W".
- These bearings can accommodate high radial loads, and are often used on machine tool spindles.

Single-row cylindrical roller bearings

Bore diameter **20 – 460 mm**

Thrust collar

Bore diameter **20 – 320 mm**

Double-row cylindrical roller bearings

NN

NNU

Bore diameter **25 – 480 mm**

Boundary dimensions	The dimensions of standard series are as specified in JIS B 1512.																																																												
Tolerances	As specified in JIS B 1514-1 (refer to Table 7-3 on pp. A 60 – A 63).																																																												
	Tolerances of roller set bore diameter F_w and roller set outside diameter E_w of interchangeable bearings are as follows : Unit : μm																																																												
	<table><tr><th colspan="2">Nominal bore diameter d (mm)</th><th colspan="2">Δ_{F_w} Roller set bore diameter deviation</th><th colspan="2">Δ_{E_w} Roller set outside diameter deviation</th></tr><tr><th>over</th><th>up to</th><th>upper</th><th>lower</th><th>upper</th><th>lower</th></tr><tr><td>–</td><td>20</td><td>+ 10</td><td>0</td><td>0</td><td>– 10</td></tr><tr><td>20</td><td>50</td><td>+ 15</td><td>0</td><td>0</td><td>– 15</td></tr><tr><td>50</td><td>120</td><td>+ 20</td><td>0</td><td>0</td><td>– 20</td></tr><tr><td>120</td><td>200</td><td>+ 25</td><td>0</td><td>0</td><td>– 25</td></tr><tr><td>200</td><td>250</td><td>+ 30</td><td>0</td><td>0</td><td>– 30</td></tr><tr><td>250</td><td>315</td><td>+ 35</td><td>0</td><td>0</td><td>– 35</td></tr><tr><td>315</td><td>400</td><td>+ 40</td><td>0</td><td>0</td><td>– 40</td></tr><tr><td>400</td><td>500</td><td>+ 45</td><td>0</td><td>–</td><td>–</td></tr></table>	Nominal bore diameter d (mm)		Δ_{F_w} Roller set bore diameter deviation		Δ_{E_w} Roller set outside diameter deviation		over	up to	upper	lower	upper	lower	–	20	+ 10	0	0	– 10	20	50	+ 15	0	0	– 15	50	120	+ 20	0	0	– 20	120	200	+ 25	0	0	– 25	200	250	+ 30	0	0	– 30	250	315	+ 35	0	0	– 35	315	400	+ 40	0	0	– 40	400	500	+ 45	0	–	–

400	500	+ 45	0	–	–																																																								
[Remark] Interchangeable bearings have an inner ring with rollers that can be matched with the outer ring, or an outer ring with rollers that can be matched with the inner ring, without affecting performance in the bearing that has the same bearing number in one category.																																																													
Tapered bore tolerance and allowable values of high precision double-row cylindrical roller bearings (classes 5 and 4) are provided in JTEKT standards (refer to Table 7-11 on p. A 76).																																																													
Radial internal clearance	· Cylindrical bore and tapered bore bearings(refer to Table 10-8 on pp. A 106, 107.) · Motor bearings.....(refer to Table 10-7 on p. A 105.)																																																												
Recommended fits	Refer to Table 9-4 on pp. A 91, 92.																																																												
Standard cages	■ For single-row cylindrical roller bearings : · Pressed cage (supplementary code : //) · Synthetic resin molded cage (supplementary code : FG) · Copper alloy machined cage (supplementary code : FY) (Copper alloy machined cages without rivets (LY) are also used for some special purposes.) For application range, refer to Table 1. ■ For double-row cylindrical roller bearings : · Prong type copper alloy machined cage (supplementary code : FY) · Separable prong type copper alloy machined cage (supplementary code : FW) for class 5 or higher precision bearings																																																												

Allowable misalignment	Allowable misalignment of single-row cylindrical roller bearings depends on bearing type and specification. General values are as follows : 1) When P_r / C_r is approx. 8% under load of normal use 0.000 6 rad (2') – 0.000 9 rad (3') 2) When P_r / C_r is approx. 5% under load lighter than 1) 0.001 2 rad (4') When very large allowable misalignment is required, consult with JTEKT.
Equivalent radial load	Dynamic equivalent radial load $P_r = F_r$ Static equivalent radial load $P_{0r} = F_r$
Allowable axial load	Cylindrical roller bearings with ribs, including loose rib and thrust collar, on both inner and outer rings accommodate axial load to a certain extent. (NJ and NF types accommodate load applied in one direction : NUP and NH in both directions.) For calculation of allowable axial load, refer to p. A 44.

[Remarks] 1) Standard cage types used for the above bearings are shown in Table 1 earlier in this section. Please note that basic load ratings and limiting speeds shown above indicate the value applicable to machined cage. Consult JTEKT about bearings with pressed cage, since they may be different from bearings with machined cage in values above.

2) Bearing numbers of NU and NJ type bearings with mounted thrust collar (refer to specification table shown after this specification table) are NUJ and NH.

1) Standard cage types used for the above bearings are shown in Table 1 earlier in this section. Please note that basic load ratings and limiting speeds shown above indicate the value applicable to machined cage. Consult JTEKT about bearings with pressed cage, since they may be different from bearings with machined cage in values above.

2) Bearing numbers of NU and NJ type bearings with mounted thrust collar (refer to specification table shown after this specification table) are NUJ and NH.

[Remarks] 1) Standard cage types used for the above bearings are shown in Table 1 earlier in this section. Please note that basic load ratings and limiting speeds shown above indicate the value applicable to machined cage. Consult JTEKT about bearings with pressed cage, since they may be different from bearings with machined cage in values above.

2) Bearing numbers of NU and NJ type bearings with mounted thrust collar (refer to specification table shown after this specification table) are NUJ and NH.

[Remarks] 1) Standard cage types used for the above bearings are shown in Table 1 earlier in this section. Please note that basic load ratings and limiting speeds shown above indicate the value applicable to machined cage. Consult JTEKT about bearings with pressed cage, since they may be different from bearings with machined cage in values above.

2) Bearing numbers of NU and NJ type bearings with mounted thrust collar (refer to specification table shown after this specification table) are NUJ and NH.

[Remarks] 1) Standard cage types used for the above bearings are shown in Table 1 earlier in this section. Please note that basic load ratings and limiting speeds shown above indicate the value applicable to machined cage. Consult JTEKT about bearings with pressed cage, since they may be different from bearings with machined cage in values above.

2) Bearing numbers of NU and NJ type bearings with mounted thrust collar (refer to specification table shown after this specification table) are NUJ and NH.

[Remarks] 1) Standard cage types used for the above bearings are shown in Table 1 earlier in this section. Please note that basic load ratings and limiting speeds shown above indicate the value applicable to machined cage. Consult JTEKT about bearings with pressed cage, since they may be different from bearings with machined cage in values above.

2) Bearing numbers of NU and NJ type bearings with mounted thrust collar (refer to specification table shown after this specification table) are NUJ and NH.

[Remarks] 1) Standard cage types used for the above bearings are shown in Table 1 earlier in this section. Please note that basic load ratings and limiting speeds shown above indicate the value applicable to machined cage. Consult JTEKT about bearings with pressed cage, since they may be different from bearings with machined cage in values above.

2) Bearing numbers of NU and NJ type bearings with mounted thrust collar (refer to specification table shown after this specification table) are NUJ and NH.

[Remarks] 1) Standard cage types used for the above bearings are shown in Table 1 earlier in this section. Please note that basic load ratings and limiting speeds shown above indicate the value applicable to machined cage. Consult JTEKT about bearings with pressed cage, since they may be different from bearings with machined cage in values above.

2) Bearing numbers of NU and NJ type bearings with mounted thrust collar (refer to specification table shown after this specification table) are NUJ and NH.

[Remarks] 1) Standard cage types used for the above bearings are shown in Table 1 earlier in this section. Please note that basic load ratings and limiting speeds shown above indicate the value applicable to machined cage. Consult JTEKT about bearings with pressed cage, since they may be different from bearings with machined cage in values above.

2) Bearing numbers of NU and NJ type bearings with mounted thrust collar (refer to specification table shown after this specification table) are NUJ and NH.

[Remarks] 1) Standard cage types used for the above bearings are shown in Table 1 earlier in this section. Please note that basic load ratings and limiting speeds shown above indicate the value applicable to machined cage. Consult JTEKT about bearings with pressed cage, since they may be different from bearings with machined cage in values above.

2) Bearing numbers of NU and NJ type bearings with mounted thrust collar (refer to specification table shown after this specification table) are NUJ and NH.

Tapered roller bearings

Tapered roller bearings are designed such that outer ring, inner ring and rollers have tapered surfaces whose apexes converge at a common point on the bearing axis. Along with metric series bearings, inch series bearings are also available.

This type of bearing is suitable for applications that involve heavy or impact loading.

Single-row tapered roller bearings

- Able to carry radial and axial load in one direction simultaneously.

Because an axial component of force is produced when this type of bearing is loaded radially, two bearings are used together facing one another, or two or more bearings are matched and used.

- There are the standard, medium and steep type which are different in contact angle size.

Medium-tapered metric series bearings are identified by the supplementary code "C" which is added as a suffix to bearing numbers.

- Bearings whose outer ring width, outer ring small inside diameter and contact angle are determined in accordance with ISO 355 specifications are identified by the supplementary code "J" as a suffix.

Inner ring assemblies and the outer rings of such bearings are interchangeable with those of bearings produced abroad if the bearing numbers are the same.

ISO sub-unit specifications

Double-row tapered roller bearings

- These bearings are divided into the TDO type which has one double outer ring and two single-row inner rings, and the TDI type which has two single-row outer rings and one double inner ring. Both accommodate radial and axial loading in both directions.

These two also carry moment loads, however, the TDO type is superior to the TDI type, because the distance between load centers (α) is longer in the TDO type.

- The spacer of the TDO type, or the TDI type, pre-adjusts the internal clearance to provide proper operating clearance after mounting.

Single-row tapered roller bearings

Metric series

Bore diameter **15 – 360 mm**

Inch series

(including J series metric bearing)

Bore diameter **9.525 – 292.100 mm**

Double-row tapered roller bearings

TDO type

Bore diameter **25 – 500 mm**

TDI type

Bore diameter **100 – 500 mm**

[Note] When supplementary code "J" is added as a prefix (not a suffix) to bearing numbers (e.g. JHM720249/JHM720210), the bearings are not designed according to ISO 355. Such bearings are called "J series metric tapered roller bearings," and are produced according to special tolerances.

Boundary dimensions	Metric single-row tapered roller bearings : as specified in JIS B 1512.																																																															
	Reference JIS B 1512 specifies new dimension series which are based on ISO 355, as well as the conventional "3XX" dimension series. These new dimension series are as follows : New dimension series (1) Angle series <table><thead><tr><th rowspan="2">Angle series</th><th colspan="2">Contact angle α</th></tr><tr><th>over</th><th>up to</th></tr></thead><tbody><tr><td>2</td><td>10°</td><td>13° 52'</td></tr><tr><td>3</td><td>13° 52'</td><td>15° 59'</td></tr><tr><td>4</td><td>15° 59'</td><td>18° 55'</td></tr><tr><td>5</td><td>18° 55'</td><td>23°</td></tr><tr><td>6</td><td>23°</td><td>27°</td></tr><tr><td>7</td><td>27°</td><td>30°</td></tr></tbody></table> (3) Width series <table><thead><tr><th rowspan="2">Width series</th><th colspan="2">$T/\{(D-d)^{0.95}\}$</th></tr><tr><th>over</th><th>up to</th></tr></thead><tbody><tr><td>B</td><td>0.50</td><td>0.68</td></tr><tr><td>C</td><td>0.68</td><td>0.80</td></tr><tr><td>D</td><td>0.80</td><td>0.88</td></tr><tr><td>E</td><td>0.88</td><td>1.00</td></tr></tbody></table> (2) Diameter series <table><thead><tr><th rowspan="2">Diameter series</th><th colspan="2">$D/(d^{0.77})$</th></tr><tr><th>over</th><th>up to</th></tr></thead><tbody><tr><td>B</td><td>3.40</td><td>3.80</td></tr><tr><td>C</td><td>3.80</td><td>4.40</td></tr><tr><td>D</td><td>4.40</td><td>4.70</td></tr><tr><td>E</td><td>4.70</td><td>5.00</td></tr><tr><td>F</td><td>5.00</td><td>5.60</td></tr><tr><td>G</td><td>5.60</td><td>7.00</td></tr></tbody></table> Remarks 1. Combine these series symbols in the listed order to make the dimension series numbers. (ex. 2BC) 2. Bearing numbers consist of a dimension series number and a bore diameter which is added as a suffix. (ex. 2BC080 : bore diameter 80 mm)	Angle series	Contact angle α		over	up to	2	10°	13° 52'	3	13° 52'	15° 59'	4	15° 59'	18° 55'	5	18° 55'	23°	6	23°	27°	7	27°	30°	Width series	$T/\{(D-d)^{0.95}\}$		over	up to	B	0.50	0.68	C	0.68	0.80	D	0.80	0.88	E	0.88	1.00	Diameter series	$D/(d^{0.77})$		over	up to	B	3.40	3.80	C	3.80	4.40	D	4.40	4.70	E	4.70	5.00	F	5.00	5.60	G	5.60	7.00

G	5.60	7.00																																																														
Tolerances	· Metric series single-row tapered roller bearings as specified in JIS B 1514-1. (refer to Table 7-5 on pp. A 66 – A 68.) · Metric series double-row tapered roller bearings as specified in BAS 1002. (refer to Table 7-6 on p. A 69.) · Inch series tapered roller bearings as specified in ABMA Section 19. (refer to Table 7-7 on pp. A 70, 71.) · J series metric tapered roller bearings the tolerance is specified separately. (refer to Table 7-8 on pp. A 72, 73.)																																																															
Internal clearance	Radial internal clearance of double-row, four-row and matched pair tapered roller bearings (refer to Table 10-10 on p. A 110.)																																																															
Recommended fits	· Metric series tapered roller bearings (classes 0, 6X and 6) (refer to Table 9-4 on pp. A 91, 92.) · Inch series tapered roller bearings (refer to Table 9-7 on pp. A 96, 97.) · J series metric tapered roller bearings (refer to Table 9-6 on pp. A 94, 95.)																																																															
Standard cage	Pressed cage (supplementary code : //) (Some large size bearings have a pin type cage (FP) instead.) (They are listed separately in the bearing specification table.)																																																															

Allowable misalignment	Single-row tapered roller bearings : 0.000 9 rad (3') (If the misalignment exceeds this angle size, JTEKT is ready to design special bearings to order.)
Equivalent radial load	■ Single-row tapered roller bearings Dynamic equivalent radial load $\left(\text{when } \frac{F_a}{F_r} \leq e \right) P_r = F_r$ $\left(\text{when } \frac{F_a}{F_r} > e \right) P_r = 0.4F_r + Y_1 F_a$ Static equivalent radial load $P_{0r} = 0.5F_r + Y_0 F_a$ when $P_{0r} < F_r$, $P_{0r} = F_r$ ■ Double-row or four-row tapered roller bearings Dynamic equivalent radial load $\left(\text{when } \frac{F_a}{F_r} \leq e \right) P_r = F_r + Y_2 F_a$ $\left(\text{when } \frac{F_a}{F_r} > e \right) P_r = 0.67F_r + Y_3 F_a$ Static equivalent radial load $P_{0r} = F_r + Y_0 F_a$ [Note] Refer to the bearing specification table for the values of axial load factors Y_1, Y_2, Y_3 and Y_0 and constant e.

[Remarks] 1. When two single-row tapered roller bearings are used together facing one another, an axial component of force is produced under radial load.
In this case, refer to pp. A 38, 39 for calculation of the dynamic equivalent radial load.
2. When the load is too small, slippage occurs between the rollers and raceways, causing smearing to develop. This also occurs to matched pair bearings when the ratio of axial load to radial load exceeds the value e shown in the specification table ($F_a / F_r > e$).
Consult with JTEKT on use of bearings under such conditions.

[Notes] 1) SP indicates the specially chamfered from.
2) To the bearings with supplementary code "J" attached at the front of bearing number, tolerances shown in table 7-8 on page A72 are applied.

[Remark] Inch series tapered roller bearings with bore diameter larger than 100 mm are shown in catalog "large size ball & roller bearings".

Single-row tapered roller bearings

Spherical roller bearings

Spherical roller bearings feature a large load rating capacity and self-aligning capability.

This type of bearing is suitable for low- or medium-speed applications which involve heavy or impact loading.

- These bearings are divided into R(RR), RZ and RHA types, which differ in internal structure. (refer to Table 1.)
- Each type can be produced with a cylindrical bore or tapered bore.

Bearings with a tapered bore can be fit and removed easily using an adapter assembly or withdrawal sleeve.

The rate of taper is equivalent among all bearing series.

240 and 241 series ... 1 : 30 (supplementary code "K30")

Others ... 1 : 12 (supplementary code "K")

Spherical roller bearings

Cylindrical bore

Tapered bore

Bore diameter **25 – 500 mm**

Adapter assemblies

Bore diameter **20 – 470 mm**

Withdrawal sleeves

Bore diameter **35 – 480 mm**

Table 1 Spherical roller bearings : types and structures

Structure	 R, RR type	 RZ type	 RHA type
Roller	Convex asymmetrical roller	Convex symmetrical roller	Convex symmetrical roller
Cage	Copper alloy prong type machined cage	Pressed cage	Copper alloy integral type machined cage
Inner ring (with or without rib)	With center rib	Without center rib (guide ring)	Without center rib (guide ring)
	With ribs on both sides (to prevent rollers from falling)	Without ribs on both sides	With ribs on both sides (to prevent rollers from falling)
Characteristics	Excellent high-speed properties	Excellent high-speed properties Large load rating capacity Usable at high temperatures (up to 200°C)	Large load rating capacity

■ Spherical roller bearings for shaker screens

- These bearings consist of convex asymmetric rollers and a prong type, copper alloy, outer ring guided, machined cage. This cage possesses optimum characteristics for use with shaker screens.
- The bearings most commonly used with shaker screens are 223 series spherical roller bearings. They are identified by the supplementary code "ROVS W502." The outer ring outside diameter tolerance of these bearings is held to a small allowable variation.

■ Bearings with lubrication holes and a lubrication groove

- Outer rings can be provided with lubrication holes, a lubrication groove and an anti-rotation pin hole. (Specifications are given in Table 4.)

Table 2 Supplementary codes for identification of bearings with lubrication holes, lubrication groove and anti-rotation pin hole (outer ring)

Supplementary code		Number of lubrication holes	Hole layout
With lubrication holes and lubrication groove	With lubrication holes, lubrication groove and anti-rotation pin hole		
W33	W3N	3 ¹⁾	3 equally spaced positions ¹⁾
W33A	W3NA	4	4 equally spaced positions
—	W3NB	5	6 equally spaced positions ²⁾
W33C	W3NC	6	6 equally spaced positions
—	W3ND	7	8 equally spaced positions ²⁾
W33T	—	8	8 equally spaced positions

[Notes] 1) Also 4 or 6 holes are provided in smaller size bearings, consult with JTEKT.

2) One hole is used for the antirotation pin.

[Remark] Boldfaced codes indicate JTEKT standards.

- Inner rings can also be provided with lubrication holes and a lubrication groove.

Table 3 Supplementary codes for identification of bearings with lubrication holes and/or lubrication groove

Supplementary code	Inner ring		Outer ring	
	Number of lubrication holes	Lubrication groove	Number of lubrication holes	Lubrication groove
W513	3	—	3	○
W518	3	—	3	—

Boundary dimensions	As specified in JIS B 1512.
Tolerances	As specified in JIS B 1514-1, class 0. (refer to Table 7-3 on pp. A 60 – A 63.) Refer to Table 7-11 on p. A 76 for the tolerance of tapered bores.
Radial internal clearance	As specified in JIS B 1520. (refer to Table 10-9 on p. A 108.)
Recommended fits	Refer to Table 9-4 on pp. A 91, 92.
Standard cages	Refer to Table 5.
Allowable aligning angle	Refer to Table 5. (varies depending on bearing series.)
Equivalent radial load	Dynamic equivalent radial load $\left(\text{When } \frac{F_a}{F_r} \leq e \right) P_r = F_r + Y_1 F_a \quad \left(\text{When } \frac{F_a}{F_r} > e \right) P_r = 0.67 F_r + Y_2 F_a$ Static equivalent radial load $P_{0r} = F_r + Y_0 F_a$ [Note] Refer to the specification table for the values of axial load factors Y_1 , Y_2 and Y_0 and of constant e .

[Remark] If the ratio of axial load to radial load exceeds the value e given in the specification table ($F_a/F_r > e$), slippage occurs between rollers in rows that are not axial-loaded and the raceway. This may cause smearing, especially when the bearing is large. Consult with JTEKT on the use of bearings under such conditions.

Basic profile and dimensions of screw thread identified by prefix Tr are in accordance with JIS B 0216.

Thrust ball bearings

Thrust ball bearings are divided into single and double direction types. The former is able to accommodate axial load in one direction, while the latter is able to accommodate it in both directions.

Neither is suitable for applications that involve radial load or high-speed rotation.

Bearings whose housing race back face is spherical (with a spherical back face or aligning seat race) are designed with a self-aligning capability and can accommodate the effects of inaccurate mounting.

Single direction thrust ball bearings

Bore diameter **10 – 360 mm**

Double direction thrust ball bearings

Bore diameter **10 – 190 mm**

Boundary dimensions	As specified in JIS B 1512.
Tolerances	As specified in JIS B 1514-2. (refer to Table 7-9 on p. A 74.)
Recommended fits	Refer to Table 9-8 on p. A 98.
Standard cages	• Pressed cage (supplementary code : //) • Copper alloy or carbon steel machined cage (supplementary code : FY or FC) • Polyamide resin molded cage (supplementary code : MG)

Application of standard cages

Required minimum axial load	A certain degree of load is necessary in order for bearings to operate satisfactorily. (refer to p. A 116.)
Allowable misalignment	Misalignment not allowed. (for flat back face type.)
Equivalent axial load	Dynamic equivalent axial load $P_a = F_a$ Static equivalent axial load $P_{0a} = F_a$

[Remark] Standard cage types used for the above bearings are described earlier in this section.

Spherical thrust roller bearings

Spherical thrust roller bearings

Bore diameter **60 – 500** mm

Spherical thrust roller bearings are designed to carry high axial loads. They can also support radial load if magnitude is no more than 55 % of the axial load being carried.

These bearings are not suitable for high-speed rotation.

Having a spherical housing race raceway surface, these bearings are self-alignings, adjusting to axial inclination.

They are usually used with oil lubrication.

Boundary dimensions	As specified in JIS B 1512.
Tolerances	As specified in JIS B 1514-2, class 0. (refer to table 7-10 on p. A 75.)
Recommended fits	Refer to Table 9-8 on p. A 98.
Required minimum axial load	A certain degree of load is necessary in order for bearings to operate satisfactorily. (refer to p. A 116.)
Standard cage	Copper alloy machined cage (supplementary code : FY)
Allowable aligning angle	0.035 – 0.052 rad (2° – 3°) in general, depending on bearing series.
Equivalent axial load	Dynamic equivalent axial load $P_a = 1.2F_r + F_a$ Static equivalent axial load $P_{0a} \doteq 2.7F_r + F_a$ (Note : $F_r / F_a \leq 0.55$)

Needle roller bearings

Needle roller bearings are small in sectional height, therefore useful in making machinery smaller and lighter. This type of bearing is used in a wide range of machinery, such as automobiles, motor cycles, electric machines, machine tools, aerospace and office equipment.

- Compact, highly rigid and superior in load carrying performance, compared with other types of bearings.
- Excellent for carrying oscillating loads; contains many small diameter rollers.
- Widely employed in stud type and yoke type track rollers used as guide rollers in cam mechanisms or linear motion units. Allowable loads of these truck rollers are examined with load ratings different from those of general bearings. For detailed information, contact us.
Also used in miniature one-way clutches in the clutch mechanisms of office equipment, such as copying machines.

The catalog also covers bearings employing rollers other than those prescribed in JIS B 1506 "rollers for roller bearings".

For details, refer to JTEKT separate catalog for Europe "Needle Roller Bearings" (CAT. NO. B2020E) and catalog for regions excluding Europe "Needle Roller Bearings" (CAT. NO. BS007EN)

(CAT. NO. B2020E)

The needle roller bearings explained in this catalog are indicated in blue.

For additional details on JTEKT's Needle Roller Bearing product line please refer to Catalogs BS007EN.

Bearings surrounded by blue lines are listed in the European catalog (CAT. NO. B2020E) and not in the non-European catalog (BS007EN).

[Tolerances of needle roller bearings]

Table 2 Tolerance grades of needle rollers (JIS B 1506)

Unit : μm			
Class	Single ¹⁾ plane diameter variation V_{Dwp} max.	Deviation ¹⁾ from circular form Δ_{Rw} max.	Gauge lot ¹⁾ diameter variation V_{DwL} max.
2	1	1	2
3	1.5	1.5	3
5	2	2.5	5

Class	Actual ²⁾ length deviation Δ_{Lws}	Recommended gauge S
2	h 13	0/- 2, - 1/- 3, - 2/- 4, - 3/- 5, - 4/- 6, - 5/- 7, - 6/- 8, - 7/- 9, - 8/- 10
3		0/- 3, - 1.5/- 4.5, - 3/- 6, - 4.5/- 7.5, - 6/- 9, - 7/- 10
5		0/- 5, - 3/- 8, - 5/- 10

[Notes] 1) Values apply only at middle of roller length.
2) Applied tolerance differs according to L_w division.

[Remark] Along the entire length of the roller, all the actually measured diameters should not exceed the actual maximum diameter at the middle of the entire length of the roller by the lengths shown below.
a) Class 2 : 0.5 μm b) Class 3 : 0.8 μm
c) Class 5 : 1 μm

Table 3 Tolerance of needle roller cage width B (JIS B 1536-3)

Bearing type	B deviation (mm)	
	upper	lower
K, K...ZW	- 0.2	- 0.55
WJ, WJC	0	- 0.38

[Remark] Values in Italics are prescribed in JTEKT standards.

[Reference] The guide width (b) should satisfy the equation : $b = B + (H11)$

Table 18 Tolerance for combined needle roller bearings (thrust component thickness (C_1))

Unit : mm

Bearing series	Tolerance	
	upper	lower
NAXK, NAXK.Z	+0	-0.200
NAXR, NAXR.Z		

**Table 17 Tolerance for inch series thrust washers
(type code : TRA, TRB, etc.)**

(1) Bore diameter Unit : mm

Nominal bore diameter d		Deviations	
over	up to	upper	lower
6.000	57.200	+0.300	+0.050
57.200	133.400	+0.430	+0.050

(2) Outside diameter Unit : mm

Nominal Outside diameter d_1		Deviations	
over	up to	upper	lower
6.000	133.400	-0.025	-0.760

[Recommended fit and internal clearance]

Table 19 Recommended fit for metric series radial needle roller and cage assemblies

Condition	Tolerance zone class		Housing bore
	Shaft		
Radial clearance	$F_w \leq 50 \text{ mm}$	$F_w > 50 \text{ mm}$	
Smaller than normal	j 5	h 5	G 6
Normal	h 5	g 5	
Larger than normal	g 6	f 6	

Table 20 Recommended fit for metric series drawn cup needle roller bearings

Bearing type	Operating condition	Shaft fit (recommended internal radial clearances)	Housing fit (recommended internal radial clearances)
HK, BK (caged)	One piece heavy section steel or cast iron housing	h5 (h6)	N6 (N7)
	Housing material of low rigidity	h5 (h6)	R6 (R7)
	Outer ring rotation (one piece heavy section steel or cast iron housing)	f5 (f6)	R6 (R7)
	Oscillating Motion	j5 (j6)	¹⁾

[Note] ¹⁾ Tolerance dependent on housing design.
 [Remark] When the bearing is provided with an inner ring, the shaft tolerance class h5 should be selected.

Table 23 Recommended fit for metric series needle roller thrust bearings

Bearing components	Shaft tolerance (shaft piloting)	Housing tolerance (housing piloting)
Needle roller and cage assembly. Types : AXK, FNT	h8	H8
Thin thrust washer. Type : AS	h8	H8
Heavy thrust washer. Type : LS	h8	H8
Shaft-piloted thrust washer. Type : WS.811	h6 (j6)	Clearance
Housing-piloted thrust washer. Type : GS.811	Clearance	H7 (K7)

Table 24 Recommended fit for metric series cylindrical roller thrust bearings

Bearing components	Shaft tolerance (shaft piloting)	Housing tolerance (housing piloting)	Piloting components
Thrust cylindrical roller and cage assembly. Types : K.811 and K.812	h8	H10	Shaft
Heavy thrust washer. Type : LS	h10	H11	Shaft
Shaft-piloted thrust washer. Types : WS.811, WS.812	h6 (j6)	Clearance	Shaft
Housing-piloted thrust washer. Types : GS.811, GS.812	Clearance	H7 (K7)	Housing

Table 21 Recommended fit for inch series drawn cup needle roller bearings

Bearing design	Shaft			Housing		
	Classification	max.	min.	Classification	max.	min.
J, JTT ¹⁾	$F_w \leq 5.556 \text{ mm (7/32")}$	0	-0.008 mm (-0.0003")	$D \leq 7.144 \text{ mm (9/32")}$	+0.013 mm (-0.0005")	0
	$5.556 \text{ mm (7/32")} < F_w \leq 50.006 \text{ mm (1 31/32")}$	0	-0.013 mm (-0.0005")			
	$50.006 \text{ mm (1 31/32")} < F_w \leq 119.856 \text{ mm (4 23/32")}$	0	-0.015 mm (-0.0006")	$7.144 \text{ mm (9/32")} < D$	+0.013 mm (-0.0005")	+0.013 mm (-0.0005")
	$119.856 \text{ mm (4 23/32")} < F_w \leq 180.181 \text{ mm (7 3/32")}$	0	-0.018 mm (-0.0007")			

[Note] ¹⁾ Special fits
 When $D = 8.733 \text{ mm (0.3438")}$: housing fit : -0.003 mm (-0.0001") maximum, -0.015 mm (-0.0006") minimum
 When $D = 22.212 \text{ mm (0.8745")}$: housing fit : +0.025 mm (+0.0010") maximum, 0 mm (0") minimum
 When $D = 152.400 \text{ mm (6.0000")}$: housing fit : +0.025 mm (+0.0010") maximum, -0.025 mm (-0.0010") minimum

Table 22 Recommended fit for metric series heavy-duty needle roller bearings

Without inner ring

Rotation conditions	Nominal housing bore diameter D (mm)	ISO tolerance zone for housing		Nominal shaft diameter F shaft (mm)	ISO tolerance zone for shaft	
		caged	full		caged	full
Load stationary relative to housing	all diameters	H7 (J7)	J6	all diameters	h6 (h5)	h5
General work with larger clearance		K7	—		g6	—
Load rotates relative to housing		N7	M6		f6	g5

[Remark] Care should be taken that the selected bearing internal clearance is appropriate for the operating conditions.

[Shaft and housing specifications]

Table 25 Specifications of shafts and housings (needle roller and cage assemblies, drawn cup needle roller bearings, and heavy-duty needle roller bearings)

	Shaft		Housing bore	
	Raceway surface	Fitting surface	Raceway surface	Fitting surface
Roundness	- Shaft diameter ≤ 25 mm : 2.5 μm or less - Shaft diameter > 25 mm : 2.5 $\mu\text{m} \times (\text{shaft diameter} / 25 \text{ mm})$ or less	One-half the shaft diameter tolerance or less	8 μm or one-half the bore tolerance or less	One-half the bore tolerance or less
Variation of mean diameter (Cylindricity)	Within the range of the bearing width, 5 μm or less per 25 mm or one-half the bearing tolerance or less (whichever is smaller)	One-half the shaft diameter tolerance or less	Within the range of the bearing width, 5 μm or less per 25 mm or one-half the bearing tolerance or less (whichever is smaller)	Within the length of the outer ring, 13 μm or one-half the diameter tolerance (whichever is smaller) or less
Surface roughness	0.2 a or less	0.8 a or less	0.2 a or less	1.6 a or less
Hardness	58 HRC or harder ¹⁾	—	58 HRC or harder ¹⁾	—
Shaft slope	13 μm or less per 25 mm		—	

[Note] 1) During the carburizing or induction-hardening of case hardened steel, not only must the surface hardness requirement specified above be met, but the case depth of HV 550 (52.3 HRC) must be met in the range of 0.08 D_w to 0.10 D_w mm. (D_w : roller diameter)

Table 26 Needle roller thrust bearing mounting surface specifications

Flatness (dishing or coning)		Maximum angle : Arctan 0.001
Squareness		Maximum angle : Arctan 0.0005
Roughness (Ra)		0.2 a or less
Hardness		58 HRC or harder (refer to the note for Table 25 above regarding depth.)

[Note] 1) ra max is equal to the minimum bearing chamfer (rs min).

Miniature one-way clutches

Miniature one-way clutches consist of a case carburizing steel drawn cup, metal or synthetic resin spring, synthetic resin cage and needle rollers.

They are used in clutch mechanisms of various machines. Use in office automation equipment such as copying and facsimile machines is especially common.

- Useful for making equipment smaller and lighter, due to a drawn cup made of thin sheet steel.
- Locking protrusions are provided around the drawn cup, so that creeping can be prevented without having to hold the surface dimensional accuracy precisely.
- Pre-lubricated with optimum grease, so that no lubrication is necessary under normal operating conditions.
- Unit products with a synthetic resin housing are also available. They are compatible with components of various types, such as gears, timing pulleys, cams and rubber rollers. Consult with JTEKT for further information.

1WC series

EWC series

Various housings and unit products

Structure and principles

[When the clutch system works]

When the shaft rotates clockwise as in cross section A-A', rollers are locked while engaged with the drawn cup cam surfaces by the effect of springs (wedging of the shaft by the cam surfaces). The drawn cup is driven as a consequence.

[Clutch idle running]

When the shaft rotates counter-clockwise as in cross section A-A', rollers move away from the drawn cup cam surfaces and rotate freely.

Miniature one-way clutch types and characteristics

	1WC series (with metal springs)	EWC series (with synthetic resin springs)	
	Heavy load type	Heavy load type	Light load type
	1WC...	EWC...C	EWC...A
Torque capacity	Heavy load	Heavy load	Light load
Operating temperature range	- 10 to + 90°C		- 10 to + 70°C
Locking life	Locking system can function more than one million. 〔 Note : this estimation is valid as long as torque magnitude does not exceed the torque capacity shown in the specification table. 〕		
Insert molding	Possible	Impossible	
Delivery of clutch only	Possible		
Unit delivery	Possible		

Shaft tolerance

	Heavy load type (1WC..., EWC...C)	Light load type (EWC...A)
Shaft tolerance class	h 8	
Surface hardness	50 HRC or harder	30 HRC or harder
Roughness (Ra)	0.3 a or less	0.8 a or less
Roundness and cylindricity	0.005 mm or less	

[Remarks] In some operating conditions, shafts need not be as accurate as shown here.

For example :

1. When clutch engaging accuracy is considered unimportant, or when a radial load or moment is not generated, the shaft diameter tolerance can be :
 - shaft diameter 6 mm or less,
 - and EWC0809 (C, A) : 0 to - 0.040 mm
 - shaft diameter 8 mm or more : h 10
2. When the loaded torque is smaller than the torque capacity, shaft surface hardness can be determined as follows :

* The diagram on the right shows approximate shaft surface hardness relative to torque ratio A.

$$\text{Torque ratio (A)} = \frac{\text{Loaded torque}}{\text{Heavy load type torque capacity}}$$

d 4 ~ 12 mm

Shaft dia. (mm)	Boundary dimensions (mm)					Torque capacity (N·m)	Designations		No. of outer ring protrusion	Recommended housing dimensions (Polyacetal resin) (mm)						Recommended housing dimensions (Steel) (mm)						(Refer.) Mass (g)

Ball bearing units

Ball bearing units consist of pre-lubricated sealed ball bearings and a housing which varies in shape.

They are capable of aligning themselves efficiently using the spherical fitting surface between the bearing and housing, effectively preventing overloads due to misalignment.
